

FEATURES

- **Guaranteed 60mA Output**
- **Regulated 12V $\pm 5\%$ Output Voltage**
- **No Inductors**
- Supply Voltage Range: 4.75V to 5.5V
- I_{CC} 0.5 μ A Typ in Shutdown
- Low Power: $I_{CC} = 300\mu$ A
- 8-Pin SO Package
- Same Pinout as LTC1262 and MAX662

APPLICATIONS

- 12V Flash Memory Programming Supplies
- Compact 12V Op Amp Supplies
- Battery-Powered Systems

DESCRIPTION

The LTC[®]1263 is a regulated 12V, 60mA output DC/DC converter. It provides the 12V $\pm 5\%$ output necessary to program double byte-wide flash memories. The output provides 60mA from input voltages as low as 4.75V without using any inductors. Only four external capacitors are required to complete an extremely small, surface mountable circuit. The output can be momentarily shorted to ground without damaging the part.

The active high TTL compatible Shutdown pin can be directly connected to a microprocessor. In the shutdown mode, the supply current typically drops to 0.5 μ A.

The LTC1263 is available in an 8-pin SO package.

LT, LTC and LT are registered trademarks of Linear Technology Corporation.

TYPICAL APPLICATION

Flash Memory Programming Supply

Output Voltage vs Load

ABSOLUTE MAXIMUM RATINGS

(Note 1)

Supply Voltage (V_{DD})	6V
Input Voltage (SHDN)	-0.3V to $V_{CC} + 0.3V$
I_{OUT} Continuous	90mA
Operating Temperature Range	0°C to 70°C
Storage Temperature Range	-65°C to 150°C
Lead Temperature (Soldering, 10 sec)	300°C

	SHDN Input Current	$V_{CC} = 5V$, $V_{SHDN} = 0V$	●	-40	-20	-5	μA
		$V_{CC} = 5V$, $V_{SHDN} = 5V$	●	-10	0	10	μA
t_{ON}	Turn-On Time	$C1 = C2 = 0.47\mu F$, $C3 = C4 = 10\mu F$ (Note 4) (Figures 1, 2)		600		μs	
t_{OFF}	Turn-Off Time	$C1 = C2 = 0.47\mu F$, $C3 = C4 = 10\mu F$ (Figures 1, 2)		10		ms	

The ● denotes specifications which apply over the full operating temperature range.

Note 1: Absolute Maximum Ratings are those values beyond which the life of a device may be impaired.

Note 2: All currents into device pins are positive; all currents out of device pins are negative. All voltages are referenced to ground unless otherwise specified.

Note 3: All typicals are given at $V_{CC} = 5V$, $T_A = 25^\circ C$.

Note 4: A higher value output capacitor can be used but the “turn-on” and “turn-off” time will increase proportionally.

PIN FUNCTIONS

C1⁻ (Pin 1): First Charge Capacitor Negative Input. Connect a $0.47\mu\text{F}$ capacitor (C1) between C1⁺ and C1⁻.

C1⁺ (Pin 2): First Charge Capacitor Positive Input. Connect a $0.47\mu\text{F}$ capacitor (C1) between C1⁺ and C1⁻.

C2⁻ (Pin 3): Second Charge Capacitor Negative Input. Connect a $0.47\mu\text{F}$ capacitor (C2) between C2⁺ and C2⁻.

C2⁺ (Pin 4): Second Charge Capacitor Positive Input. Connect a $0.47\mu\text{F}$ capacitor (C2) between C2⁺ and C2⁻.

V_{CC} (Pin 5): Positive Supply Input. $4.75\text{V} \leq V_{\text{CC}} \leq 5.5\text{V}$. Requires a $10\mu\text{F}$ bypass capacitor to ground (C4).

V_{OUT} (Pin 6): 12V Output. Requires a $10\mu\text{F}$ or a higher value bypass capacitor to ground (C3). $V_{\text{OUT}} = V_{\text{CC}}$ when in the shutdown mode.

GND (Pin 7): Ground.

SHDN (Pin 8): Active-High TTL Logic Level Shutdown Pin. SHDN is internally pulled up to V_{CC} . Connect to GND for normal operation. In shutdown mode, the charge pump is turned off and $V_{\text{OUT}} = V_{\text{CC}}$.

OPERATION

The LTC1263 uses a charge pump tripler to generate 12V from a V_{CC} of 5V. The charge pump is clocked by an internal oscillator. The oscillator frequency is not critical and may vary from the typical value of 300kHz. When the oscillator output is low, C1 and C2 are each connected between V_{CC} and GND, charging them to V_{CC} (see Figure 3). When the oscillator output goes high, C1 and C2 are stacked in series with the bottom plate of C1 pulled to V_{CC} (see Figure 4). The top plate of C2 is switched to charge C_{OUT} , which enables V_{OUT} to rise.

V_{OUT} is regulated to within 5% of 12V by an oscillator pulse gating scheme that turns the charge pump on and off based on the comparator results of V_{OUT} and a reference voltage. First, a resistor divider senses V_{OUT} ; if the output of the divider (V_{DIV}) is less than the output of a bandgap (V_{BGAP}) by the hysteresis voltage (V_{HYST}) of the comparator, then oscillator pulses are applied to the charge pump to raise V_{OUT} . When V_{DIV} is above V_{BGAP} by V_{HYST} , the

oscillator pulses are prevented from clocking the charge pump. As a result, V_{OUT} drops until V_{DIV} is below V_{BGAP} by V_{HYST} again.

To ensure proper start-up when V_{OUT} is lower than V_{CC} and maintain proper operation when V_{OUT} is higher than V_{CC} , the gates of all internal switches are driven between GND and the higher of either V_{OUT} or V_{CC} .

To reduce supply current, the LTC1263 may be put into shutdown mode by “floating” the SHDN pin or connecting it to V_{CC} . In this mode, the bandgap, comparator, oscillator and resistor divider are switched off to reduce the supply current to typically 0.5 μ A. At the same time an internal switch shorts V_{OUT} to V_{CC} ; V_{OUT} takes 10ms (typ) to reach 5.1V (see t_{OFF} in Figure 1). When the SHDN pin is low, the LTC1263 exits shutdown and the charge pump operates to raise V_{OUT} to 12V. V_{OUT} takes 600 μ s (typ) to reach the lower regulation limit of 11.4V (see t_{ON} in Figure 1).

APPLICATIONS INFORMATION

Choice of Capacitors

The LTC1263 is tested with the capacitors shown in Figure 2. C1 and C2 are 0.47 μ F ceramic capacitors and C_{IN} and C_{OUT} are 10 μ F tantalum capacitors. Refer to Table 1 if other choices are desired.

Table 1. Recommended Capacitor Types and Values

CAPACITOR	CERAMIC	TANTALUM	ALUMINUM
C1, C2	0.47 μ F to 1 μ F	Not Recommended	Not Recommended
C_{OUT}	10 μ F (Min)	10 μ F (Min)	10 μ F (Min)
C_{IN}	10 μ F (Min)	10 μ F (Min)	10 μ F (Min)

C1 and C2 should be ceramic capacitors with values in the range of 0.47 μ F to 1 μ F. Higher values provide better load regulation. Tantalum capacitors are not recommended as the higher ESR of these capacitors degrades performance at high load currents and $V_{CC} = 4.75$ V.

C_{IN} and C_{OUT} can be ceramic, tantalum or electrolytic capacitors. The ESR of C_{OUT} introduces steps in the V_{OUT} waveform whenever the charge pump charges C_{OUT} . This tends to increase V_{OUT} ripple. Ceramic or tantalum capacitors are recommended for C_{OUT} if minimum ripple is

APPLICATIONS INFORMATION

desired. (The LTC1263 does not require a $0.1\mu\text{F}$ capacitor between V_{CC} and V_{OUT} for stability.)

Besides using it to program flash memories, the LTC1263 can also provide multiple supply voltages with the help of

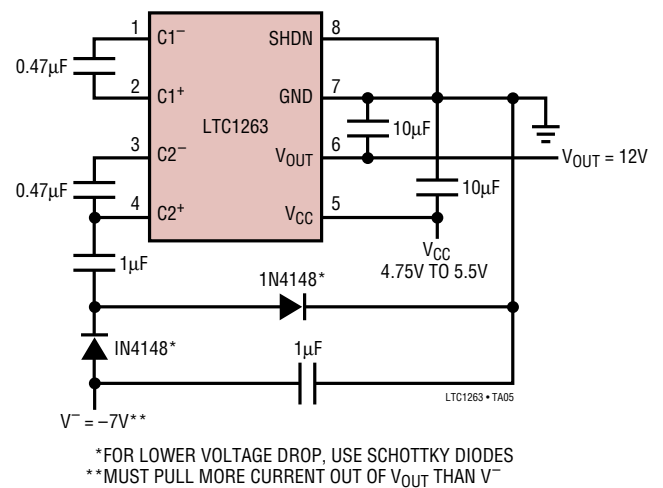

two diodes and two capacitors. Output voltages of 19V and -7V can easily be obtained. In other words, the LTC1263 can power dual supply ($\pm 5\text{V}$) and single supply (15V) op amps.
