

Internally Trimmed Precision IC Multiplier

Data Sheet AD632

FEATURES

Pretrimmed to $\pm 0.5\%$ maximum 4-quadrant error All inputs (X, Y, and Z) differential, high impedance for $[(X_1-X_2)(Y_1-Y_2)/10]+Z_2 \text{ transfer function}$ Scale-factor adjustable to provide up to $\times 10$ gain Low noise design: 90 mV rms, 10 Hz to 10 kHz Low cost, monolithic construction Excellent long-term stability

APPLICATIONS

High quality analog signal processing
Differential ratio and percentage computations
Algebraic and trigonometric function synthesis
Accurate voltage controlled oscillators and filters

GENERAL DESCRIPTION

The AD632 is an internally trimmed monolithic four-quadrant multiplier/divider. The AD632B has a maximum multiplying error of $\pm 0.5\%$ without external trims.

Excellent supply rejection, low temperature coefficients, and long-term stability of the on-chip thin film resistors and buried zener reference preserve accuracy even under adverse conditions. The simplicity and flexibility of use provide an attractive alternative approach to the solution of complex control functions.

The AD632 is pin-for-pin compatible with the industry standard AD532 but with improved specifications and a fully differential high impedance Z input. The AD632 is capable of providing gains of up to $\times 10$, frequently eliminating the need for separate instrumentation amplifiers to precondition the inputs. The AD632 can be effectively employed as a variable gain differential input amplifier with high common-mode

FUNCTIONAL BLOCK DIAGRAM

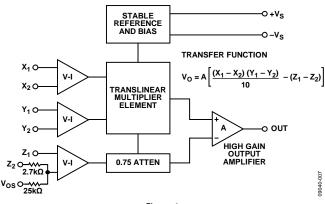

Figure 1.

rejection. The effectiveness of the variable gain capability is enhanced by the inherent low noise of the AD632 at 90 μV rms.

PRODUCT HIGHLIGHTS

- 1. Guaranteed performance over temperature.
- 2. The AD632A and AD632B are specified for maximum multiplying errors of ±1.0% and ±0.5% of full scale, respectively, at +25°C and are rated for operation from -25°C to +85°C.
- 3. Maximum multiplying errors of ±2.0% (AD632S) and ±1.0% (AD632T) are guaranteed over the extended temperature range of -55°C to +125°C.
- 4. High reliability.
- The AD632S and AD632T series are available with MIL-STD-883 Level B screening.
- 6. All devices are available in either the hermetically sealed TO-100 metal can or ceramic DIP package.

 $^{^1}$ Figures given are percent of full-scale, ± 10 V (that is, 0.01% = 1 mV). 2 Can be reduced to 3 V using an external resistor between –Vs and SF. 3 Irreducible component due to nonlinearity: excludes effect of offsets. 4 Using an external resistor adjusted to give a value of SF = 3 V. 5 See the functional block diagram (Figure 1) for definition of sections.

Figure 7. Basic Multiplier Connection

When needed, the user can reduce ac feedthrough to a minimum (as in a suppressed carrier modulator) by applying an external trim voltage (±30 mV range required) to the X or Y input. Figure 4 shows the typical ac feedthrough with this adjustment mode. Note that the feedthrough of the Y input is a factor of 10 lower than that of the X input and is to be used for applications where null suppression is critical.

The Z_2 terminal of the AD632 can be used to sum an additional signal into the output. In this mode, the output amplifier behaves as a voltage follower with a 1 MHz small signal bandwidth and a 20 V/µs slew rate. Always reference this terminal to the ground point of the driven system, particularly if this is remote. Likewise, reference the differential inputs to their respective signal common potentials to realize the full accuracy of the AD632.

A much lower scaling voltage can be achieved without any reduction of input signal range using a feedback attenuator, as shown in Figure 8. In this example, the scale is such that $V_{\rm OUT} = XY$, so that the circuit can exhibit a maximum gain of 10. This connection results in a reduction of bandwidth to about 80 kHz without the peaking capacitor, C_F . In addition, the output offset voltage is increased by a factor of 10 making external adjustments necessary in some applications.

Feedback attenuation also retains the capability for adding a signal to the output. Signals can be applied to the Z terminal, where they are amplified by -10, or to the common ground connection where they are amplified by -1. Input signals can also be applied to the lower end of the $2.7~\mathrm{k}\Omega$ resistor, giving a gain of +9.

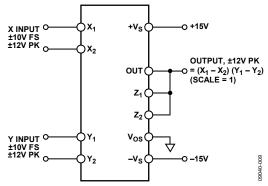

Figure 8. Connections for Scale Factor of Unity

OPERATION AS A DIVIDER

Figure 9 shows the connection required for division. Unlike earlier products, the AD632 provides differential operation on both the numerator and the denominator, allowing the ratio of two floating variables to be generated. Further flexibility results from access to a high impedance summing input to Y_1 . As with all dividers based on the use of a multiplier in a feedback loop, the bandwidth is proportional to the denominator magnitude, as shown in Figure 6.

The accuracy of the AD632 B-model is sufficient to maintain a 1% error over a 10 V to 1 V denominator range.

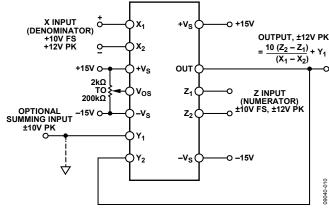

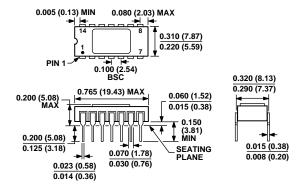

Figure 9. Basic Divider Connection
