### Signal Chain Power Input Connection Board

### DESCRIPTION

Demonstration circuit SCP-INPUT-EVALZ is a companion hardware tool designed to allow external connections when building power systems. It will accept standard banana jacks and clip-lead type connectors to attach to power supplies and meters.

Like all boards in the Signal Chain Power series, this board is designed to be easily plugged into other SCP boards to form a complete signal chain power system, enabling fast evaluation of low power signal chains. To evaluate this board, some universal SCP hardware is required, namely:

SCP-FILTER-EVALZ	SCP-OUTPUT-EVALZ
SCP-1X2BKOUT-EVALZ	SCP-1X5BKOUT-EVALZ
SCP-5X1-EVALZ	SCP-THRUBRD-EVALZ

To properly evaluate SCP series demo boards, you will need the SCP Configurator companion software. SCP Configurator can help you choose the right board and topology for your design.

# **QUICK START PROCEDURE**

Demonstration circuit SCP-INPUT-EVALZ is easy to set up to evaluate the performance of any SCP hardware configuration.

- The SCP-INPUT-EVALZ ships with a bi-directional LED to indicate applied voltage. To set the limiting resistor, see "Configuration Settings" section, and modify the board accordingly. Be sure to check for open connections or solder shorts after making any modifications.
- 2. Connect the SCP-INPUT-EVALZ and SCP-OUTPUT-EVALZ boards to the SCP board under evaluation (refer to Figure 2) and connect the input board to a voltage source, V<sub>SOURCE</sub>. Connect the output board to a voltmeter or dynamic load. Slowly raise the input voltage until the SCP-INPUT-EVALZ powers up the device under test into regulation and sweep V<sub>SOURCE</sub> through the desired range of operation.

NOTE: Make sure that the input voltage is always within spec. If using a dynamic load to measure output voltage, make sure the load is initially set to zero.

- 3. Check for proper output voltage. The output should be regulated at the programmed value  $(\pm 5\%)$ .
- Once the proper output voltage is established, power off V<sub>SOURCE</sub> and similarly test other boards in the SCP system until all elements have been individually verified prior to assembling into the final circuit configuration.

NOTE: When measuring the input or output voltage ripple, use the optional SMA connector locations available on the input, output,  $1 \times 5$ ,  $1 \times 2$ , and  $5 \times 1$  breakout boards. Avoid using the test point connections with long scope leads.

### SIGNAL MEASUREMENT CONFIGURATION

The input has a vertical SMA output connector for easy connection to test or measurement equipment. It can also be used to carry power into the system in a coaxial environment, if desired. Additionally, the banana jacks are spaced at 0.750" for use with BNC (female) to double stacking banana plug type adapters (Pomona model 1269 or equivalent). The spacing also allows for close connection to power supplies with this standard.
