# WICED™ IEEE 802.11 a/b/g/n SoC with an Embedded Applications Processor

The Cypress CYW43907 embedded wireless system-on-a-chip (SoC) is uniquely suited for Internet-of-Things applications. It supports all rates specified in the IEEE 802.11 a/b/g/n specifications. The device includes an ARM Cortex-based applications processor, a single stream IEEE 802.11n MAC/baseband/radio, a dual-band 5 GHz and 2.4 GHz transmit power amplifier (PA), and a receive low-noise amplifier (LNA). It also supports optional antenna diversity for improved RF performance in difficult environments.

The CYW43907 is an optimized SoC targeting embedded Internet-of-Things applications in the industrial and medical sensor, home appliance, and embedded audio markets. Using advanced design techniques and process technology to reduce active and idle power, the device is designed for embedded applications that require minimal power consumption and a compact size.

The device includes a PMU for simplifying system power topology and allows for direct operation from a battery while maximizing battery life.

## Cypress Part Numbering Scheme

Cypress is converting the acquired IoT part numbers from Broadcom to the Cypress part numbering scheme. Due to this conversion, there is no change in form, fit, or function as a result of offering the device with Cypress part number marking. The table provides Cypress ordering part number that matches an existing IoT part number.

**Table 1. Mapping Table for Part Number between Broadcom and Cypress**

Broadcom Part Number	Cypress Part Number
BCM43907	CYW43907
BCM43907KWBG	CYW43907KWBG

## Features

### Application Processor Features

- ARM Cortex-R4 32-bit RISC processor.
- 2 MB of on-chip SRAM for code and data.
- An on-chip cryptography core
- 640 KB of ROM containing WICED SDK components such as RTOS and TCP/IP stack.
- 17 GPIOs supported.
- Q-SPI serial flash interface to support up to 40 Mbps of peak transfer.
- Support for UART (3), SPI or CSC master (2), CSC-only (2), and I<sup>2</sup>S (2) interfaces. (Cypress Serial Control (CSC) is an I<sup>2</sup>C-compatible interface.)
- Dedicated fractional PLL for audio clock (MCLK) generation.
- USB 2.0 host and device modes.
- SDIO 3.0 host and device modes.

### Key IEEE 801.11x Features

- IEEE 802.11n compliant.
- Single-stream spatial multiplexing up to 150 Mbps.
- Supports 20/40 MHz channels with optional SGI.
- Full IEEE 802.11 a/b/g legacy compatibility with enhanced performance.
- TX and RX low-density parity check (LDPC) support for improved range and power efficiency.
- On-chip power and low-noise amplifiers.
- An internal fractional nPLL allows support for a wide range of reference clock frequencies.
- Integrated ARM Cortex-R4 processor with tightly coupled memory for complete WLAN subsystem functionality, minimizing the need to wake up the applications processor for standard WLAN functions (to further minimize power consumption while maintaining the ability to upgrade to future features in the field).
- Software architecture supported by standard WICED SDK allows easy migration from existing discrete MCU designs and to future devices.

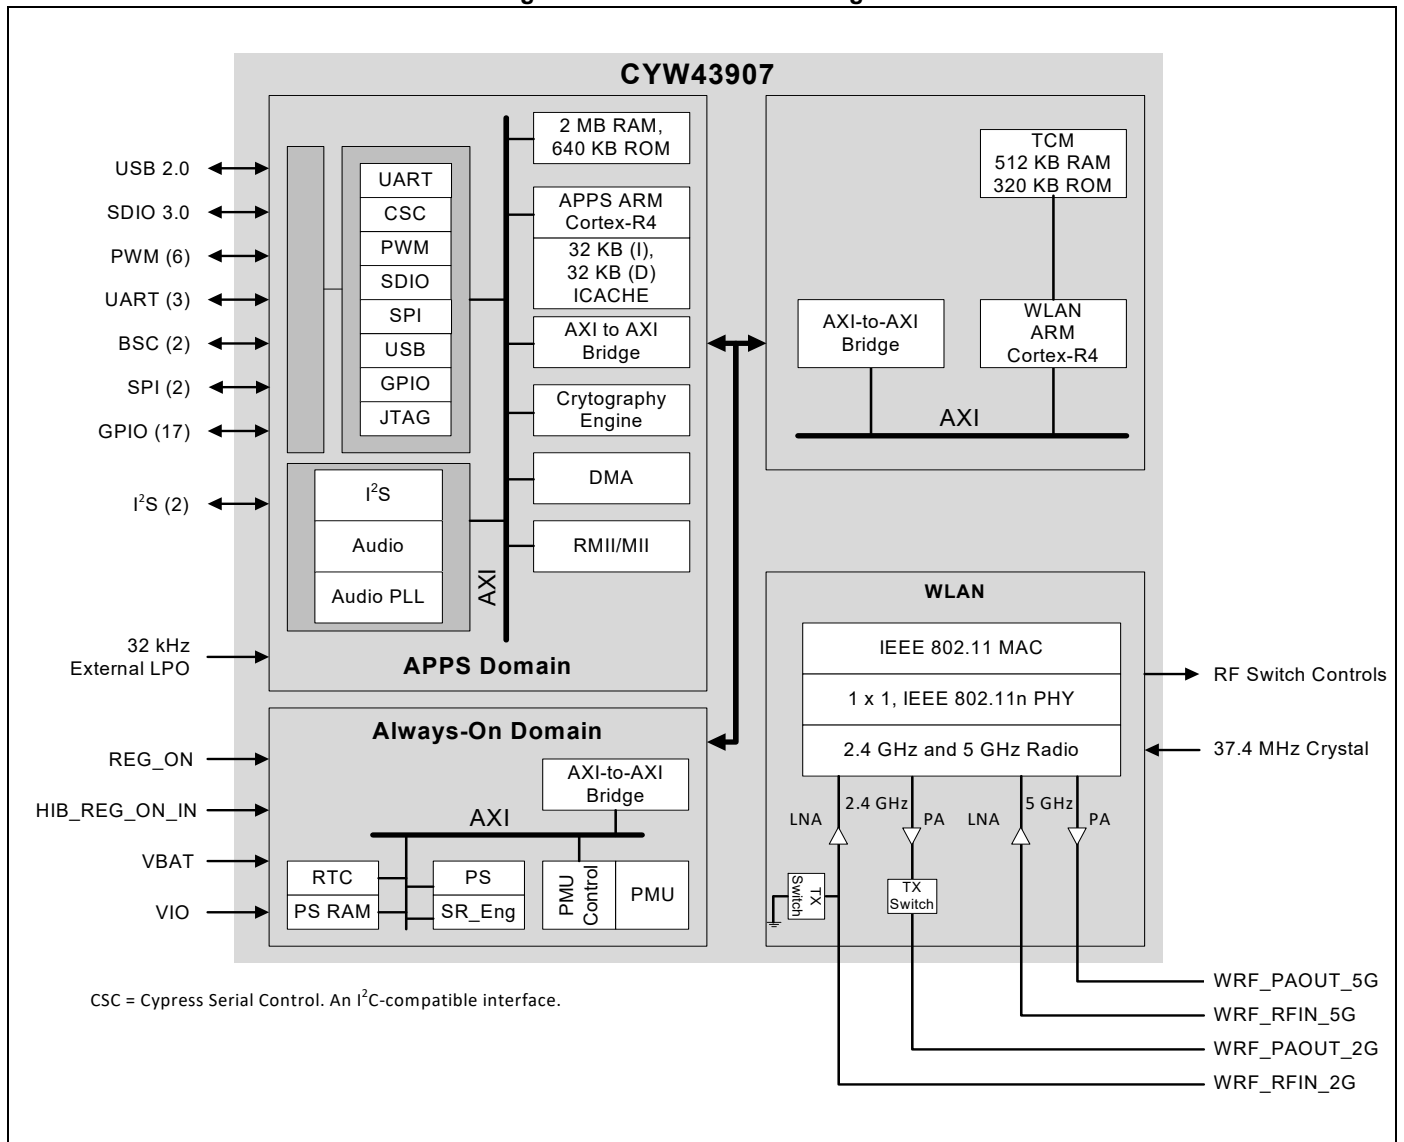

- Security support:
  - WPA and WPA2 (Personal) support for powerful encryption and authentication.
  - AES and TKIP in hardware for faster data encryption and IEEE 802.11i compatibility.
  - Reference WLAN subsystem provides Cisco Compatible Extensions (CCX, CCX 2.0, CCX 3.0, CCX 4.0, and CCX 5.0).
  - Wi-Fi Protected Setup and Wi-Fi Easy-Setup

- Worldwide regulatory support: Global products supported with worldwide design approval.

**General Features**

- Supports battery voltage range from 3.0V to 4.8V with an internal switching regulator.
- Programmable dynamic power management.
- 6 Kb OTP memory for storing board parameters.
- 316-bump WLCSP (4.583 mm × 5.533mm, 0.2mm pitch)..

## 1. Overview

### 1.1 Introduction

The Cypress CYW43907 is a single-chip device that provides the highest level of integration for an embedded system-on-a-chip with integrated IEEE 802.11 a/b/g/n MAC/baseband/radio and a separate ARM Cortex-R4 applications processor. It provides a small form-factor solution with minimal external components to drive down cost for mass volumes and allows for an embedded system with flexibility in size, form, and function. Comprehensive power management circuitry and software ensure that the system can meet the needs of highly embedded systems that require minimal power consumption and reliable operation.

Figure 2 shows the interconnect of all the major physical blocks in the CYW43907 and their associated external interfaces, which are described in greater detail in Section 5. “Applications Subsystem External Interfaces”.

Figure 2. Block Diagram and I/O

#### 1.1.1 Features

The CYW43907 supports the following features:

- ARM Cortex-R4 clocked at 160 MHz (in 1× mode) or up to 320 MHz (in 2× mode).
  - 2 MB of SRAM and 640 KB ROM available for the applications processor.
  - One high-speed 4-wire UART interface with operation up to 4 Mbps.
  - Two low-speed 2-wire UART interfaces multiplexed on general purpose I/O (GPIO) pins.
  - Two dedicated CSC<sup>1</sup> interfaces.
  - Two SPI master interfaces with operation up to 24 MHz.
- Note:** Either or both of the SPI interfaces can be used as CSC master interfaces. This is in addition to the two dedicated CSC interfaces.
- One SPI master interface for serial flash.

1. Cypress Serial Control (CSC) is an I<sup>2</sup>C-compatible interface.

- Six dedicated PWM outputs.
- Two I<sup>2</sup>S interfaces.
- 17 GPIOs.
- IEEE 802.11 a/b/g/n 1×1 2.4 GHz and 5 GHz radio.
- Single- and dual-antenna support.

## 1.2 Standards Compliance

The CYW43907 supports the following standards:

- IEEE 802.11n
- IEEE 802.11b
- IEEE 802.11g
- IEEE 802.11d
- IEEE 802.11h
- IEEE 802.11i
- Security:
  - WEP
  - WPA Personal
  - WPA2 Personal
  - WMM
  - WMM-PS (U-APSD)
  - WMM-SA
  - AES (hardware accelerator)
  - TKIP (hardware accelerator)
  - CKIP (software support)
- Proprietary Protocols:
  - CCXv2
  - CCXv3
  - CCXv4
  - CCXv5
  - WFAEC

The CYW43907 supports the following additional standards:

- IEEE 802.11r—Fast Roaming (between APs)
- IEEE 802.11w—Secure Management Frames
- IEEE 802.11 Extensions:
  - IEEE 802.11e QoS enhancements (already supported as per the WMM specification)
  - IEEE 802.11i MAC enhancements
  - IEEE 802.11k radio resource measurement

## 2. Power Supplies and Power Management

### 2.1 Power Supply Topology

One core buck regulator, multiple LDO regulators, and a power management unit (PMU) are integrated into the CYW43907. All regulators are programmable via the PMU. These blocks simplify power supply design for application and WLAN functions in embedded designs.

A single VBAT (3.0V to 4.8V DC maximum) and VIO supply (1.8V to 3.3V) can be used, with all additional voltages being provided by the regulators in the CYW43907.

The REG\_ON control signal is used to power up the regulators and take the appropriate sections out of reset. The CBUCK, CLDO, LNLDO, and other regulators power up when any of the reset signals are deasserted. All regulators are powered down only when REG\_ON is deasserted. The regulators may be turned off/on based on the dynamic demands of the digital baseband.

The CYW43907 provides a low power-consumption mode whereby the CBUCK, CLDO, and LNLDO regulators are shut down. When in this state, the low-power linear regulator (LPLDO1) supplied by the system VIO supply provides the CYW43907 with all required voltages.

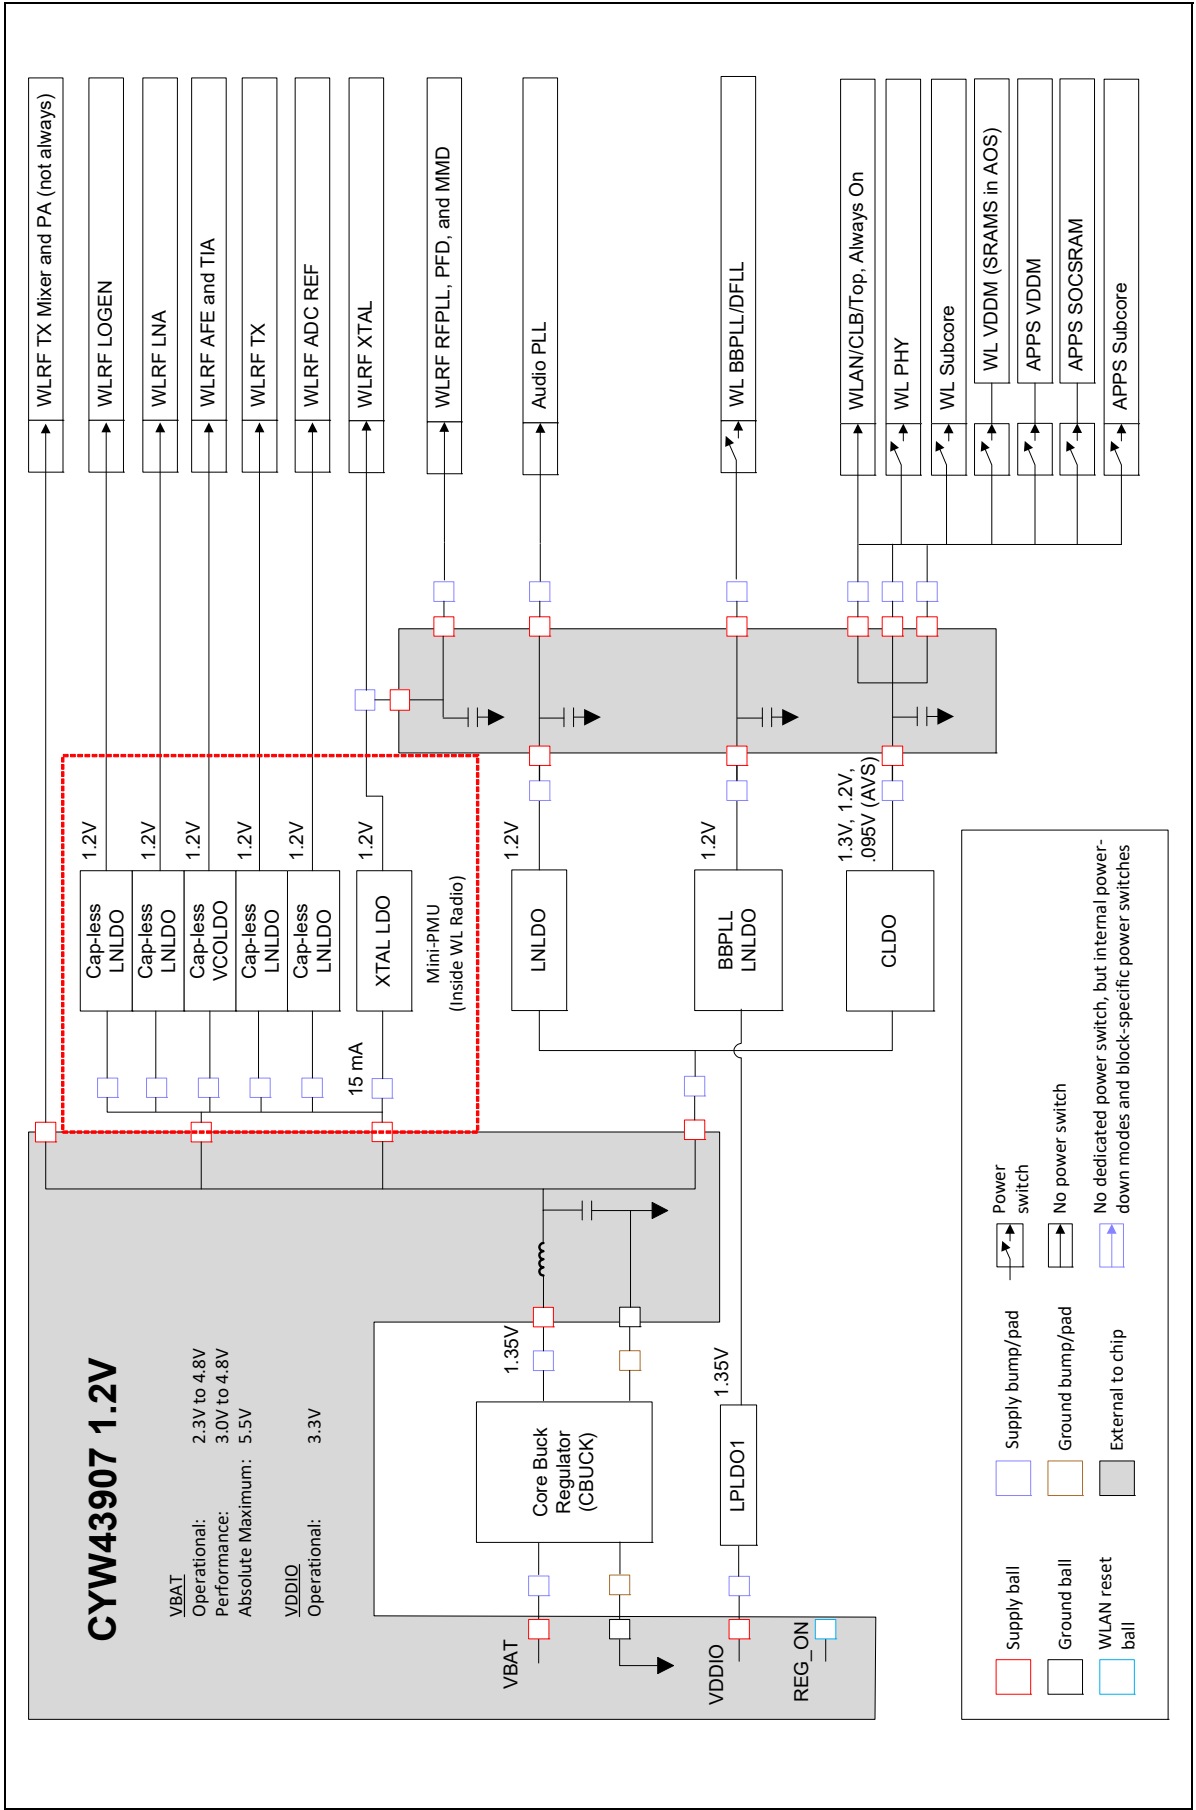

### 2.2 CYW43907 Power Management Unit Features

The CYW43907 supports the following Power Management Unit (PMU) features:

- VBAT to 1.35V<sub>out</sub> (550 mA maximum) core buck (CBUCK) switching regulator
- VBAT to 3.3V<sub>out</sub> (450 mA maximum) LDO3P3
- 1.35V to 1.2V<sub>out</sub> (150 mA maximum) LNLDO
- 1.35V to 1.2V<sub>out</sub> (350 mA maximum) CLDO with bypass mode for deep-sleep
- 1.35V to 1.2V<sub>out</sub> (55 mA maximum) LDO for BBPLL
- Additional internal LDOs (not externally accessible)
- PMU internal timer auto-calibration by the crystal clock for precise wake-up timing from the low power-consumption mode.

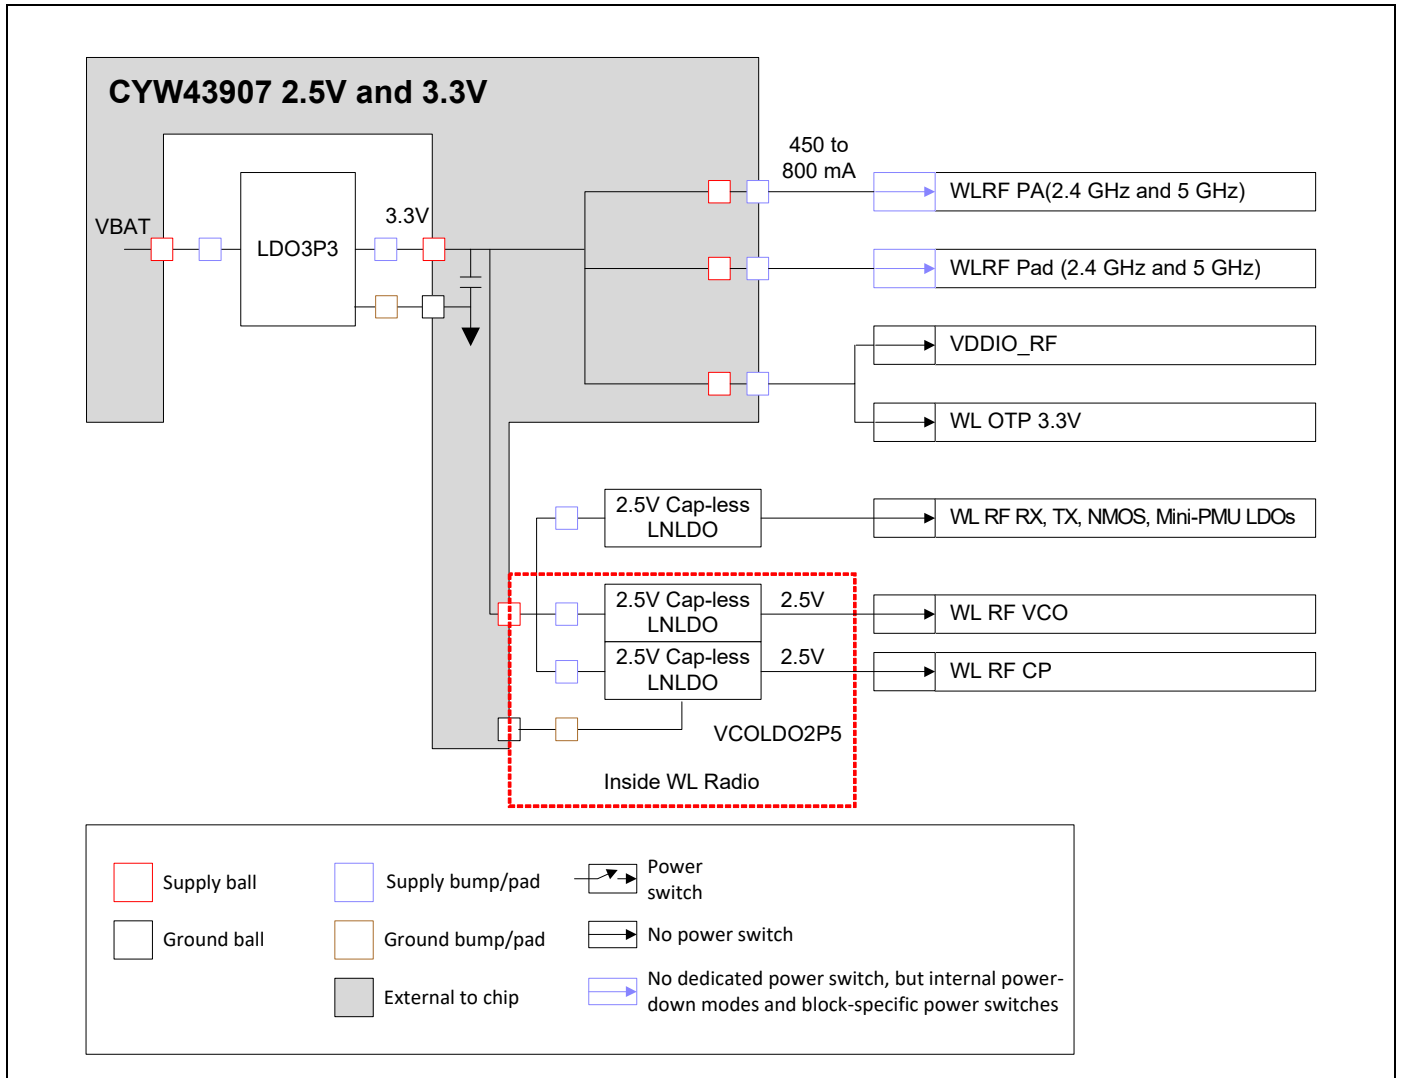

[Figure 3](#) and [Figure 4](#) show the regulators and a typical power topology.

Figure 3. Typical Power Topology (Page 1 of 2)

**Figure 4. Typical Power Topology (Page 2 of 2)**

### 2.3 Power Management

The CYW43907 has been designed with the stringent power consumption requirements of mobile devices in mind. All areas of the chip design are optimized to minimize power consumption. Silicon processes and cell libraries were chosen to reduce leakage current and supply voltages. Additionally, the CYW43907 includes an advanced Power Management Unit (PMU) sequencer. The PMU sequencer provides significant power savings by putting the CYW43907 into various power management states appropriate to the environment and activities that are being performed. The power management unit enables and disables internal regulators, switches, and other blocks based on a computation of the required resources and a table that describes the relationship between resources and the time needed to enable and disable them. Power-up sequences are fully programmable. Configurable, free-running counters (running at a 32.768 kHz LPO clock) in the PMU sequencer are used to turn on and turn off individual regulators and power switches. Clock speeds are dynamically changed (or gated altogether) as a function of the mode. Slower clock speeds are used whenever possible.

Table 2 provides descriptions for the CYW43907 power modes.

**Table 2. CYW43907 Power Modes**

Mode	Description
Active	All WLAN blocks in the CYW43907 are powered up and fully functional with active carrier sensing and frame transmission and receiving. All required regulators are enabled and put in the most efficient mode based on the load current. Clock speeds are dynamically adjusted by the PMU sequencer.
Doze	The radio, analog domains, and most of the linear regulators are powered down. The rest of the CYW43907 remains powered up in an idle state. All main clocks (PLL, crystal oscillator, or TCXO) are shut down to minimize active power consumption. The 32.768 kHz LPO clock is available only for the PMU sequencer. This condition is necessary to allow the PMU sequencer to wake up the chip and transition to Active mode. In Doze mode, the primary power consumed is due to leakage current.
Deep-sleep	Most of the chip, including both analog and digital domains and most of the regulators, is powered off. Logic states in the digital core are saved and preserved in a retention memory in the Always-On domain before the digital core is powered off. Upon a wake-up event triggered by the PMU timers, an external interrupt, or a host resume through the USB bus, logic states in the digital core are restored to their pre-deep-sleep settings to avoid lengthy HW reinitialization.
Power-down	The CYW43907 is effectively powered off by shutting down all internal regulators. The chip is brought out of this mode by external logic re-enabling the internal regulators.

### 2.4 PMU Sequencing

The PMU sequencer minimizes system power consumption. It enables and disables various system resources based on a computation of required resources and a table that describes the relationship between resources and the time required to enable and disable them.

Resource requests can come from several sources: clock requests from cores, the minimum resources defined in the *ResourceMin* register, and the resources requested by any active resource-request timers. The PMU sequencer maps clock requests into a set of resources required to produce the requested clocks.

Each resource is in one of the following four states:

- enabled
- disabled
- transition\_on
- transition\_off

The timer contains 0 when the resource is enabled or disabled and a nonzero value when in a transition state. The timer is loaded with the time\_on or time\_off value of the resource after the PMU determines that the resource must be enabled or disabled and decrements on each 32.768 kHz PMU clock. When it reaches 0, the state changes from transition\_off to disabled or transition\_on to enabled. If the time\_on value is 0, the resource can transition immediately from disabled to enabled. Similarly, a time\_off value of 0

indicates that the resource can transition immediately from enabled to disabled. The terms *enable sequence* and *disable sequence* refer to either the immediate transition or the timer load-decrement sequence.

During each clock cycle, the PMU sequencer performs the following actions:

- Computes the required resource set based on requests and the resource dependency table.
- Decrements all timers whose values are nonzero. If a timer reaches 0, the PMU clears the ResourcePending bit of the resource and inverts the ResourceState bit.
- Compares the request with the current resource status and determines which resources must be enabled or disabled.
- Initiates a disable sequence for each resource that is enabled, is no longer being requested, and has no powered-up dependents.
- Initiates an enable sequence for each resource that is disabled, is being requested, and has all of its dependencies enabled.

### 2.5 Power-Off Shutdown

The CYW43907 provides a low-power shutdown feature that allows the device to be turned off while the host, and any other system devices remain operational. When the CYW43907 is not needed in the system, VDDIO\_RF and VDDC are shut down while VDDIO remains powered. This allows the CYW43907 to be effectively off while keeping the I/O pins powered so that they do not draw extra current from devices connected to the I/O.

During a low-power shutdown state, provided VDDIO remains applied to the CYW43907, all outputs are tristated and most inputs signals are disabled. Input voltages must remain within the limits defined for normal operation. This is done to prevent current paths or create loading on any digital signals in the system, and enables the CYW43907 to be fully integrated in an embedded device while taking full advantage of the lowest power-saving modes.

When the CYW43907 is powered on from this state, it is the same as a normal power-up and does not retain any information about its state from before it was powered down.

### 2.6 Power-Up/Power-Down/Reset Circuits

The CYW43907 has two signals (see [Table 3](#)) that enable or disable circuits and the internal regulator blocks, allowing the host to control power consumption. For timing diagrams of these signals and the required power-up sequences, see [Section 18. “Power-Up Sequence and Timing”](#).

**Table 3. Power-Up/Power-Down/Reset Control Signals**

Signal	Description
REG_ON	This signal is used by the PMU to power up the CYW43907. It controls the internal CYW43907 regulators. When this pin is high, the regulators are enabled and the device is out of reset. When this pin is low, the device is in reset and the regulators are disabled. This pin has an internal 200 kΩ pull-down resistor that is enabled by default. It can be disabled through programming.
HIB_REG_ON_IN	This signal is used by the hibernation block to decide whether or not to power down the internal CYW43907 regulators. If HIB_REG_ON_IN is low, the regulators will be disabled. For a signal at HIB_REG_ON_IN to function as intended, HIB_REG_ON_OUT must be connected to REG_ON.

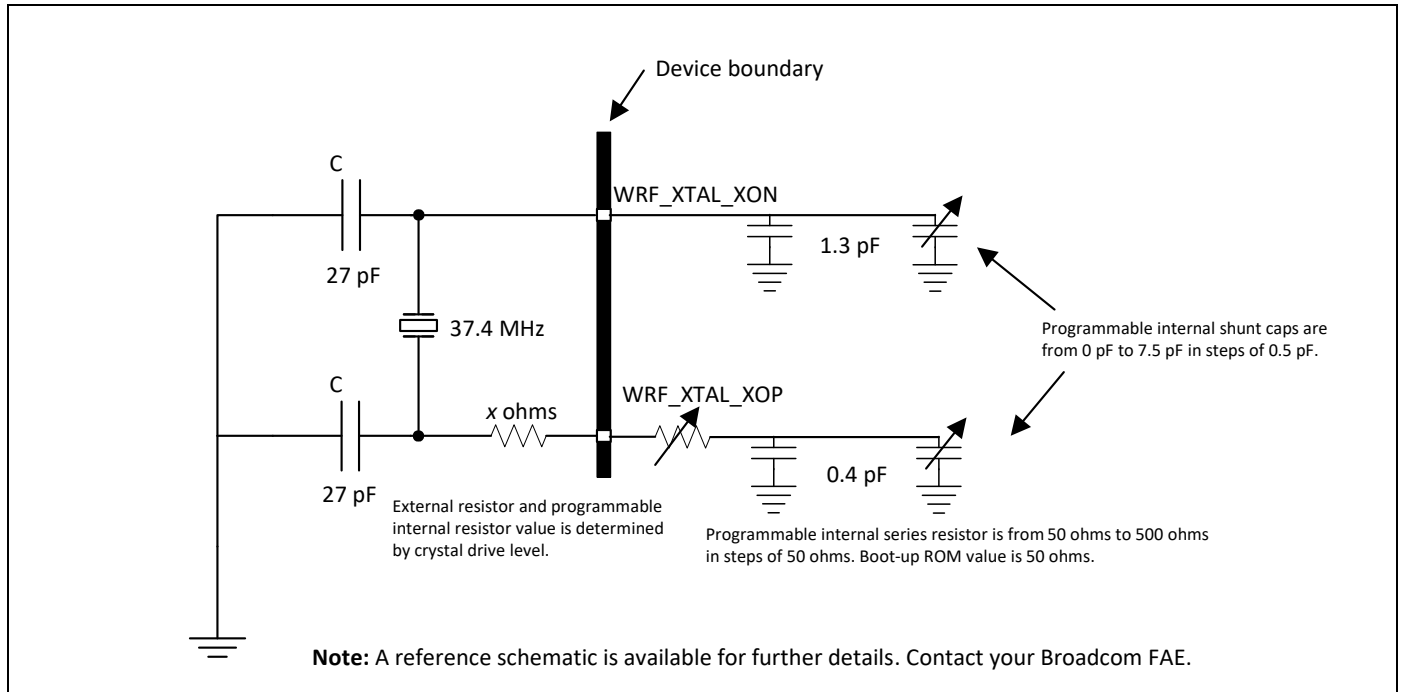

### 3. Frequency References

An external crystal is used for generating all radio frequencies and normal-operation clocking. As an alternative, an external frequency reference can be used. In addition, a low-power oscillator (LPO) is provided for lower power mode timing.

#### 3.1 Crystal Interface and Clock Generation

The CYW43907 can use an external crystal to provide a frequency reference. The recommended crystal oscillator configuration, including all external components, is shown in [Figure 5](#). Consult the reference schematics for the latest configuration.

**Figure 5. Recommended Oscillator Configuration**

A fractional-N synthesizer in the CYW43907 generates the radio frequencies, clocks, and data/packet timing, enabling it to operate using a wide selection of frequency references.

The recommended default frequency reference is a 37.4 MHz crystal. The signal characteristics for the crystal interface are listed in [Table 4](#).

**Note:** Although the fractional-N synthesizer can support alternative reference frequencies, frequencies other than the default require support to be added in the driver, plus additional extensive system testing. Contact Cypress for further details.

### 3.2 External Frequency Reference

As an alternative to a crystal, an external precision frequency reference can be used, provided that it meets the phase noise requirements listed in [Table 4](#).

If used, the external clock should be connected to the WRF\_XTAL\_XON pin through an external 1000 pF coupling capacitor, as shown in [Figure 6](#). The internal clock buffer connected to this pin will be turned off when the CYW43907 goes into sleep mode. When the clock buffer turns on and off, there will be a small impedance variation. Power must be supplied to the WRF\_XTAL\_VDD1P35 pin.

**Figure 6. Recommended Circuit to Use With an External Reference Clock**

**Table 4. Crystal Oscillator and External Clock—Requirements and Performance**

Parameter	Conditions/Notes	Crystal <sup>a</sup>			External Frequency Reference <sup>b c</sup>			Units
		Min.	Typ.	Max.	Min.	Typ.	Max.	
Frequency	2.4 GHz and 5 GHz bands: IEEE 802.11a/b/g/n operation	–	37.4	–	–	–37.4	–	MHz

WRF_XTAL_XON input voltage (see <a href="#">Figure 6</a> )	IEEE 802.11n AC-coupled analog input	–	–	–	1	–	–	V <sub>p-p</sub>
Duty cycle	37.4 MHz clock	–	–	–	40	50	60	%
Phase noise <sup>d</sup> (IEEE 802.11b/g)	37.4 MHz clock at 10 kHz offset	–	–	–	–	–	–129	dBc/Hz
	37.4 MHz clock at 100 kHz offset	–	–	–	–	–	–136	dBc/Hz
Phase noise <sup>d</sup> (IEEE 802.11a)	37.4 MHz clock at 10 kHz offset	–	–	–	–	–	–137	dBc/Hz
	37.4 MHz clock at 100 kHz offset	–	–	–	–	–	–144	dBc/Hz
Phase noise <sup>d</sup> (IEEE 802.11n, 2.4 GHz)	37.4 MHz clock at 10 kHz offset	–	–	–	–	–	–134	dBc/Hz
	37.4 MHz clock at 100 kHz offset	–	–	–	–	–	–141	dBc/Hz

**Table 4. Crystal Oscillator and External Clock—Requirements and Performance (Cont.)**

Parameter	Conditions/Notes	Crystal <sup>a</sup>			External Frequency Reference <sup>b c</sup>			Units
		Min.	Typ.	Max.	Min.	Typ.	Max.	
Phase noise <sup>d</sup> (IEEE 802.11n, 5 GHz)	37.4 MHz clock at 10 kHz offset	–	–	–	–	–	–142	dBc/Hz
	37.4 MHz clock at 100 kHz offset	–	–	–	–	–	–149	dBc/Hz

- a. (Crystal) Use WRF\_XTAL\_XON and WRF\_XTAL\_XOP.
- b. See “External Frequency Reference” for alternative connection methods.
- c. It is the responsibility of the equipment designer to select oscillator components that comply with these specifications.
- d. Assumes that external clock has a flat phase noise response above 100 kHz.

### 3.3 External 32.768 kHz Low-Power Oscillator

The CYW43907 uses a secondary low frequency clock for low-power-mode timing. Either the internal low-precision LPO or an external 32.768 kHz precision oscillator is required. The internal LPO frequency range is approximately 33 kHz ± 30% over process, voltage, and temperature, which is adequate for some applications. However, one tradeoff caused by this wide LPO tolerance is a small current consumption increase during power save mode that is incurred by the need to wake-up earlier to avoid missing beacons.

Whenever possible, the preferred approach is to use a precision external 32.768 kHz clock that meets the requirements listed in [Table 5](#).

**Table 5. External 32.768 kHz Sleep Clock Specifications**

Parameter	LPO Clock	Units
Nominal input frequency	32.768	kHz
Frequency accuracy	±200	ppm
Duty cycle	30–70	%
Input signal amplitude	200–3300	mV, p-p
Signal type	Square-wave or sine-wave	–
Input impedance <sup>a</sup>	>100k <5	Ω pF
Clock jitter (during initial start-up)	<10,000	ppm

- a. When power is applied or switched off.

## 4. Applications Subsystem

### 4.1 Overview

The Applications subsystem contains the general use CPU, memory, the standalone DMA core, the cryptography core, and the majority of the external interfaces.

### 4.2 Applications CPU and Memory Subsystem

This subsystem has an integrated 32-bit ARM Cortex-R4 processor with an internal 32 KB D-cache and an internal 32 KB I-cache. The ARM Cortex-R4 is a low-power processor that features a low gate count, low interrupt latency, and low-cost debugging capabilities. It is intended for deeply embedded applications that require fast interrupt response features. The ARM Cortex-R4 implements the ARM v7-R architecture and supports the Thumb-2 instruction set.

At 0.19  $\mu\text{W}/\text{MHz}$ , the Cortex-R4 is the most power efficient general-purpose microprocessor available, outperforming 8- and 16-bit devices on a MIPS/ $\mu\text{W}$  basis. It also supports integrated sleep modes.

Using multiple technologies to reduce cost, the ARM Cortex-R4 enables improved memory utilization, reduced pin overhead, and reduced silicon area. It also has extensive debugging features, including real-time tracing of program execution.

On-chip memory for the CPU includes 2 MB SRAM, 640 KB ROM, and an 8 KB RAM powered independently of the application subsystem.

### 4.3 Memory-to-Memory DMA Core

The CYW43907 memory-to-memory DMA (M2MDMA) engine contains eight DMA channel pairs, each containing one transmit/pull engine and one receive/push engine.

The DMA engine provides general purpose data movement between memories that can be on the device, attached directly to the device, or accessed through a host interface. The transmit/pull engine reads data from the source memory and immediately passes it to the paired receive/push engine, which proceeds to write it to the destination memory. Multiple masters can program the individual channels, and multiple interrupts are provided so that interrupts for different channels can be routed separately to different masters.

### 4.4 Cryptography Core

This core provides general purpose data movement between memories, which may be either on the device, attached directly to the device, or accessed through a host interface. The transmit/pull engine reads data from the source memory and passes it immediately to the paired receive/push engine that proceeds to write it to the destination memory. Multiple masters may program the individual channels, and multiple interrupts are provided so that interrupts for different channels can be routed separately to different masters.

The cryptography block provides a hardware accelerator for enciphering and deciphering data that has undergone processing using standards-based encryption algorithms. The cryptography block includes the following primary features:

- Encryption and hash engines that support single pass AUTH-ENC or ENC-AUTH processing.
- A scalable AES module that supports CBC, ECB, CTR, CFB, OFB, and XTS encryption with 128-, 192-, and 256-bit key sizes.
- A scalable DES module that supports DES and 3DES in ECB and CBC modes.
- An RC4 stream cipher module that supports state initialization, state update, and key-stream generation.
- MD5, SHA1, SHA224, and SHA256 engines that support pure hash or HMAC operations.
- A built-in 512-byte key cache for locally protected key storage.

OTP memory is used to store authentication keys.

## 5. Applications Subsystem External Interfaces

### 5.1 Ethernet MAC Controller (MII/RMII)

The CYW43907 integrates a high performance Ethernet MAC controller. The controller interfaces to an external PHY either over a Media Independent Interface (MII) or a Reduced Media Independent Interface (RMII). The controller can transmit and receive data at 10 Mbps and 100 Mbps.

### 5.2 GPIO

There are 17 general-purpose I/O (GPIO) pins available on the CYW43907. The GPIOs can be used to connect to various external devices.

Upon power-up and reset, these pins are tristated. Subsequently, they can be programmed to be either input or output pins via the GPIO control register. In addition, the GPIO pins can be assigned to various other functions.

Apart from other functions, GPIOs are used to set bootstrap options and use the JTAG interface for debugging during software development.

### 5.3 Cypress Serial Control

The CYW43907 has two Cypress Serial Control (CSC<sup>2</sup>) master interfaces for external communication with codecs, DACs, NVRAM, etc. The I/O pads can be configured as pull-ups or pull-downs can be installed on the reference design to support a multimaster on an open drain bus.

The I2C0 CSC master interface can support repeated start, however it does not support clock stretching. The I2C1 CSC master interface does not support repeated start or clock stretching. The CSC master can support a maximum clock frequency of 400kHz.

If clock stretching is required a bit banging driver is recommended. Cypress's WICED SDK provides an example of such a bit banging I<sup>2</sup>C driver. Note that only I<sup>2</sup>C0 mentioned in [Table 11](#) is multiplexed with GPIOs and supports bit banging. I<sup>2</sup>C1 is not multiplexed with GPIOs and therefore cannot support bit banging.

### 5.4 I<sup>2</sup>S

The CYW43907 has two I<sup>2</sup>S interfaces for audio signal data. The two interfaces are identical. Each interface supports both Master and Slave modes.

The following signals apply to the first I<sup>2</sup>S interface:

- I<sup>2</sup>S bit clock: I<sup>2</sup>S\_SCLK0 (sometimes referred to as I<sup>2</sup>S\_BITCLK)
- I<sup>2</sup>S word select: I<sup>2</sup>S\_LRCK0 (sometimes referred to as I<sup>2</sup>S\_WS)
- I<sup>2</sup>S serial data out: I<sup>2</sup>S\_SDATAO0
- I<sup>2</sup>S serial data in: I<sup>2</sup>S\_SDATAI0
- I<sup>2</sup>S master clock: I<sup>2</sup>S\_MCLK0

The following signals apply to the second I<sup>2</sup>S interface:

- I<sup>2</sup>S bit clock: I<sup>2</sup>S\_SCLK1 (sometimes referred to as I<sup>2</sup>S\_BITCLK)
- I<sup>2</sup>S word select: I<sup>2</sup>S\_LRCK1 (sometimes referred to as I<sup>2</sup>S\_WS)
- I<sup>2</sup>S serial data out: I<sup>2</sup>S\_SDATAO1
- I<sup>2</sup>S serial data in: I<sup>2</sup>S\_SDATAI1
- I<sup>2</sup>S master clock: I<sup>2</sup>S\_MCLK1

I<sup>2</sup>S\_SDATAO0 and I<sup>2</sup>S\_SDATAO1 are outputs.

I<sup>2</sup>S\_MCLK, I<sup>2</sup>S\_SCLK and I<sup>2</sup>S\_LRCLK can be configured as either inputs or outputs depending on whether the master clock source is on- or off-chip and whether the I<sup>2</sup>S is operating in Slave or Master mode.

Channel word lengths of 16 bits, 20 bits, 24 bits, and 32 bits are supported, and the data is justified so that the MSB of the left-channel data is aligned with the MSB of the I<sup>2</sup>S bus, per the I<sup>2</sup>S specification. The MSB of each data word is transmitted one bit-clock cycle

---

2. Cypress Serial Control is an I<sup>2</sup>C compatible interface.

after the I<sup>2</sup>S\_LRCK transition, synchronous with the falling edge of the bit clock. Left-channel data is transmitted when I<sup>2</sup>S\_LRCK is low, and right-channel data is transmitted when I<sup>2</sup>S\_LRCK is high. An embedded 128 × 32-bit single-port SRAM for data processing enhances the performance of the interface.

An audio PLL generates an internal master clock (for I<sup>2</sup>S\_MCLK0 and I<sup>2</sup>S\_MCLK1) that provides support for various sampling rates.

**Note:** In I<sup>2</sup>S slave mode if LRCLK changes on the rising edge of the bit clock, the MSB data bit is set half of a bit cycle after LRCLK.

Table 6 shows the MCLK rates (in MHz) associated with each of the various sample rates. In the table, FS refers to the sample rate in kHz and typical MCLK rates are shaded.

**Table 6. Variable Sample Rate and MCLK Rate Support<sup>a</sup>**

Sample Rate (kHz)	MCLK Rate (MHz) <sup>b</sup>							
	128 × FS	192 × FS	256 × FS	384 × FS	512 × FS	640 × FS	768 × FS	1152 × FS
8	1.024	1.536	2.048	3.072	4.096	5.12	6.144	9.216
11.025	1.4112	2.1168	2.8224	4.2336	5.6448	7.056	8.4672	12.7008
12	1.536	2.304	3.072	4.608	6.144	7.68	9.216	13.824
16	2.048	3.072	4.096	6.144	8.192	10.24	12.288	18.432
22.05	2.8224	4.2336	5.6448	8.4672	11.2896	14.112	16.9344	25.4016
24	3.072	4.608	6.144	9.216	12.288	15.36	18.432	27.648
32	4.096	6.144	8.192	12.288	16.384	20.48	24.576	36.864
44.1	5.6448	8.4672	11.2896	16.9344	22.5792	28.224	33.8688	–
48	6.144	9.216	12.288	18.432	24.576	30.72	36.864	–
64	8.192	12.288	16.384	24.576	32.768	–	–	–
88.2	11.2896	16.9344	22.5792	33.8688	–	–	–	–
96	12.288	18.432	24.576	36.864	–	–	–	–
192	24.576	36.864	–	–	–	–	–	–

a. All data in the table assumes a crystal frequency of 37.4 MHz.

b. MCLK frequency errors are less than 1 ppb.

For an MCLK specification, see Table 45.

### 5.5 JTAG and ARM Serial Wire Debug

The CYW43907 supports the IEEE 1149.1 JTAG boundary scan standard for performing device package and PCB assembly testing during manufacturing. In addition, the JTAG interface allows Cypress to assist customers by using proprietary debug and characterization test tools during board bring-up. Therefore, it is highly recommended to provide access to the JTAG pins by means of test points or a header on all PCB designs.

The CYW43907 also supports ARM Serial Wire Debug (SWD) for connecting a JTAG debugger directly to both ARM Cortex-R4s. For SWD, the combination of a clock and a bidirectional signal (on a single pin) provides normal JTAG debug and test functionality. The reduced pin-count SWD interface is a high-performance alternative to the JTAG interface.

Table 7 shows the JTAG\_SEL and TAP\_SEL states for test and debug function selection. Test and debug function selection is independent of the debugging interface (JTAG or SWD) being used.

**Table 7. JTAG\_SEL and TAP\_SEL States for Test and Debug Function Selection**

JTAG_SEL State	TAP_SEL State	Test and Debug Function
0	0	JTAG not used.
0	1	JTAG not used.
1	0	Access the LV tap directly for ATE and bring-up.
1	1	Access either of the ARM Cortex-R4's directly via either the 5-pin JTAG port or the 2-pin SWD configuration.

**Note:** JTAG\_SEL is exposed on a dedicated physical pin. TAP\_SEL uses the GPIO\_8 physical pin.

### 5.6 PWM

The CYW43907 provides up to six independent pulse width modulation (PWM) channels. The following features apply to the PWM channels:

- Each channel is a square wave generator with a programmable duty cycle.
- Each channel generates its duty cycle by dividing down the input clock.
- Both the high and low duration of the duty cycle can be divided down independently by a 16-bit divider register.
- Each channel can work independently or update simultaneously.
- Pairs of PWM outputs can be inverted for devices that need a differential output.
- Continuous or single pulses can be generated.
- The input clock can either be a high-speed clock from a PLL channel or a lower speed clock at the crystal frequency.

### 5.7 SDIO 3.0

#### 5.7.1 SDIO 3.0—Device Mode

##### Description

The CYW43907 WLAN section supports SDIO version 3.0, including the new UHS-I modes:

- DS: Default speed (DS) up to 25 MHz, including 1- and 4-bit modes (3.3V signaling).
- HS: High-speed up to 50 MHz (3.3V signaling).
- SDR12: SDR up to 25 MHz (1.8V signaling).
- SDR25: SDR up to 50 MHz (1.8V signaling).

**Note:** The CYW43907 is backward compatible with SDIO v2.0 host interfaces.

The following three functions are supported:

- Function 0 Standard SDIO function (max. BlockSize/ByteCount = 32B)
- Function 1 Backplane Function to access the internal SoC address space (max. BlockSize/ByteCount = 64B)

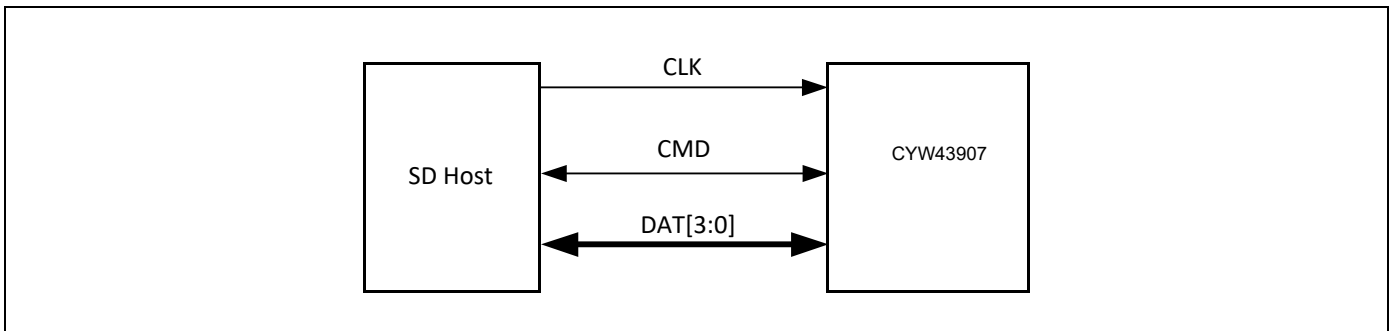

- Function 2 WLAN Function for efficient WLAN packet transfer through DMA (max. BlockSize/ByteCount = 512B)

**SDIO Pins**

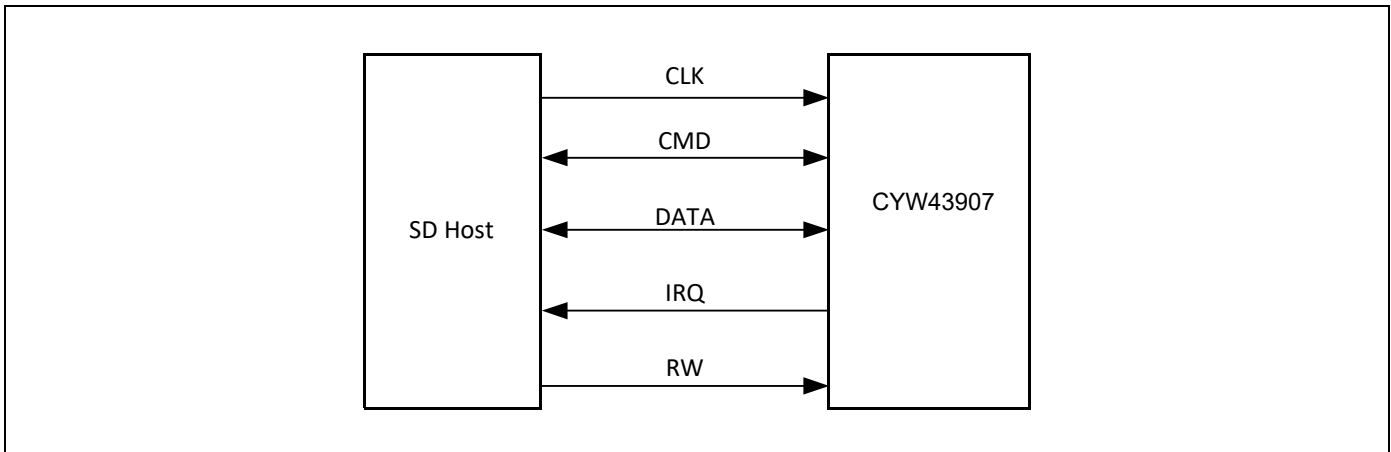

**Table 8. SDIO Pin Descriptions**

SD 4-Bit Mode		SD 1-Bit Mode	
DATA0	Data line 0	DATA	Data line
DATA1	Data line 1 or Interrupt	IRQ	Interrupt
DATA2	Data line 2 or Read Wait	RW	Read Wait
DATA3	Data line 3	N/C	Not used
CLK	Clock	CLK	Clock
CMD	Command line	CMD	Command line

**Figure 7. Signal Connections to an SDIO Host (SD 4-Bit Mode)**

**Figure 8. Signal Connections to an SDIO Host (SD 1-Bit Mode)**

**Note:** Per Section 6 of the SDIO specification, pull-ups in the 10 kΩ to 100 kΩ range are required on the four data (DATA) lines and the command (CMD) line. This requirement must be met during all operating states either through the use of external pull-up resistors or through proper programming of the SDIO host’s internal pull-ups

### 5.7.2 SDIO 3.0—Host Mode

The CYW43907 WLAN section supports SDIO version 3.0, including the new UHS-I modes:

- DS: Default speed (DS) up to 25 MHz, including 1- and 4-bit modes (3.3V signaling).
- HS: High-speed up to 50 MHz (3.3V signaling).
- SDR12: SDR up to 25 MHz (1.8V signaling).
- SDR25: SDR up to 50 MHz (1.8V signaling).

**Note:** The CYW43907 is backward compatible with SDIO v2.0 devices.

In this mode, the device supports the following features:

- ADMA2.
- Out-of-band signaling for card detection, write protection, and I/O voltage levels (which are available on GPIOs).
- Dynamic, specification-compliant shifting from 3.3V to 1.8V I/Os.

### 5.8 S/PDIF

S/PDIF is a serial audio data transport format used to connect consumer audio devices such as CD players, DVD players, and surround-sound receivers. Although S/PDIF can be used to transport uncompressed audio formats, the primary use case for the CYW43907 S/PDIF interface is to transport multichannel compressed audio for surround-sound applications, especially Dolby Digital and DTS, to an auxiliary external audio processor.

The CYW43907 can support two S/PDIF interfaces via the I2S\_SDATA00 and I2S\_SDATA01 pins. Because each S/PDIF interface uses an I<sup>2</sup>S data line, only I<sup>2</sup>S or S/PDIF functionality can be enabled on each I<sup>2</sup>S interface.

Each S/PDIF interface has the following key requirements:

- S/PDIF transmissions that conform with IEC 60958-1 (receiver not required).
- Support for linear PCM audio data that conforms with IEC 60948-3.
- Support for nonlinear PCM audio data that conforms with IEC 60948-3.
- Support for priority payload formats that include IEC 61937-3 (AC-3) and IEC 61937-5 (DTS).
- Support for sample rates from 32 kHz to 192 kHz.
- Support for 16, 20, and 24-bit audio samples.
- Support for only one concurrent compressed audio stream.

### 5.9 SPI Flash

The SPI flash interface supports the following features:

- A SPI-compatible serial bus.
- An 80 MHz (maximum) clock frequency.
- Increased Throughput to 40 MBps in Quad-mode or upto 10 MBps in single Mode<sup>3</sup>.
- Support for either ×1 or ×4 addresses with ×4 data.
- 3-bytes and 4-byte addressing modes.
- A configurable dummy-cycle count that is programmable from 1 to 15.
- Programmable instructions output to serial flash.
- An option to change the sampling edge from rising-edge to falling-edge for read-back data when in high-speed mode.

3. Note that the clock needs to be constrained to ~26.67MHz for reliable operation at high operating temperatures. The throughput of the SPI Flash block is therefore restricted to ~13 MBps for Quad mode and ~3 MBps for single mode.

### 5.10 UART

A high-speed 4-wire CTS/RTS UART interface can be enabled by software and has dedicated pins. Provided primarily for debugging during development, this UART enables the CYW43907 to operate as RS-232 data termination equipment (DTE) for exchanging and managing data with other serial devices. It is compatible with the industry standard 16550 UART and provides a FIFO size of 64 × 8 in each direction.

There are two low-speed UART interfaces on the CYW43907. Each functions as a standard 2-wire UART. They are also enabled as alternate functions on GPIOs and can be enabled independently of the 4-wire fast UART.

**Note:** The high-speed, 4-wire UART interface is identified as UART0 in this document and in reference schematics. The two low-speed, 2-wire UART interfaces are identified as UART1 and UART2 in this document and in the reference schematics.

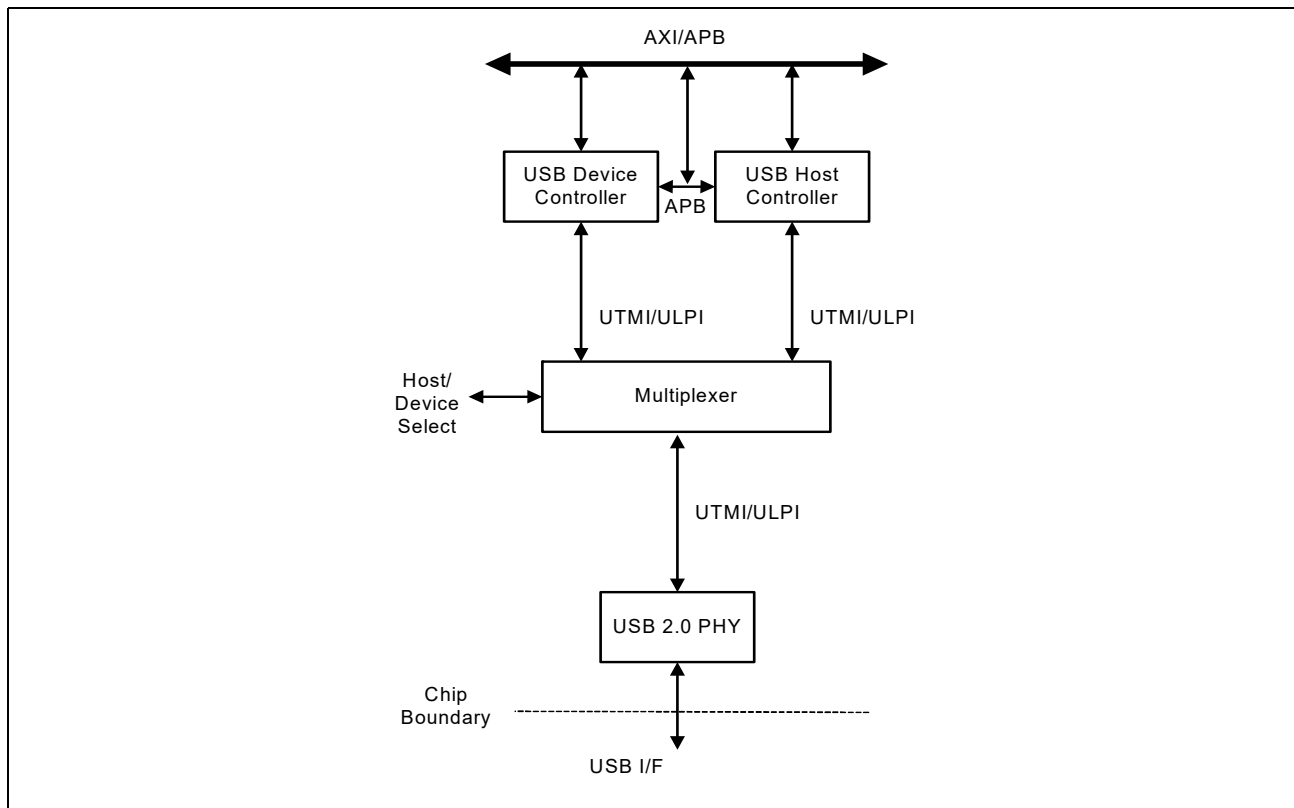

### 5.11 USB 2.0

#### 5.11.1 Overview

The USB 2.0 host controller (HC) and device controller (DC) interface to a backplane via Advanced eXtensible Interface (AXI) and Advanced Peripheral Bus (APB). They interface externally through a USB 2.0 and HSIC interfaces.

Figure 9 shows the topology of the USB 2.0 core.

Figure 9. Topology of the USB 2.0 Core

The CYW43907 contains both a USB 2.0 HC and DC. Therefore, it can operate in the host-only, device-only, and dual-role device (DRD) modes. In DRD mode, the CYW43907 can be configured as either the host or a device on the fly but must remain in the same mode until the next boot cycle. The restriction that the host or device mode remains fixed during a boot cycle is what differentiates DRD from On-the-Go (OTG).

The state of the USB2\_DSEL pin sets the mode as either host or device for USB Type A and Type B connectors. For a USB Micro-AB connector, the USB2\_DSEL pin sets the mode as either host or device while the overall mode is DRD.

Table 9 shows the supported application cases. The table also shows the USB mode and PHY type, the connector type, and the USB2\_DSEL state associated with each case.

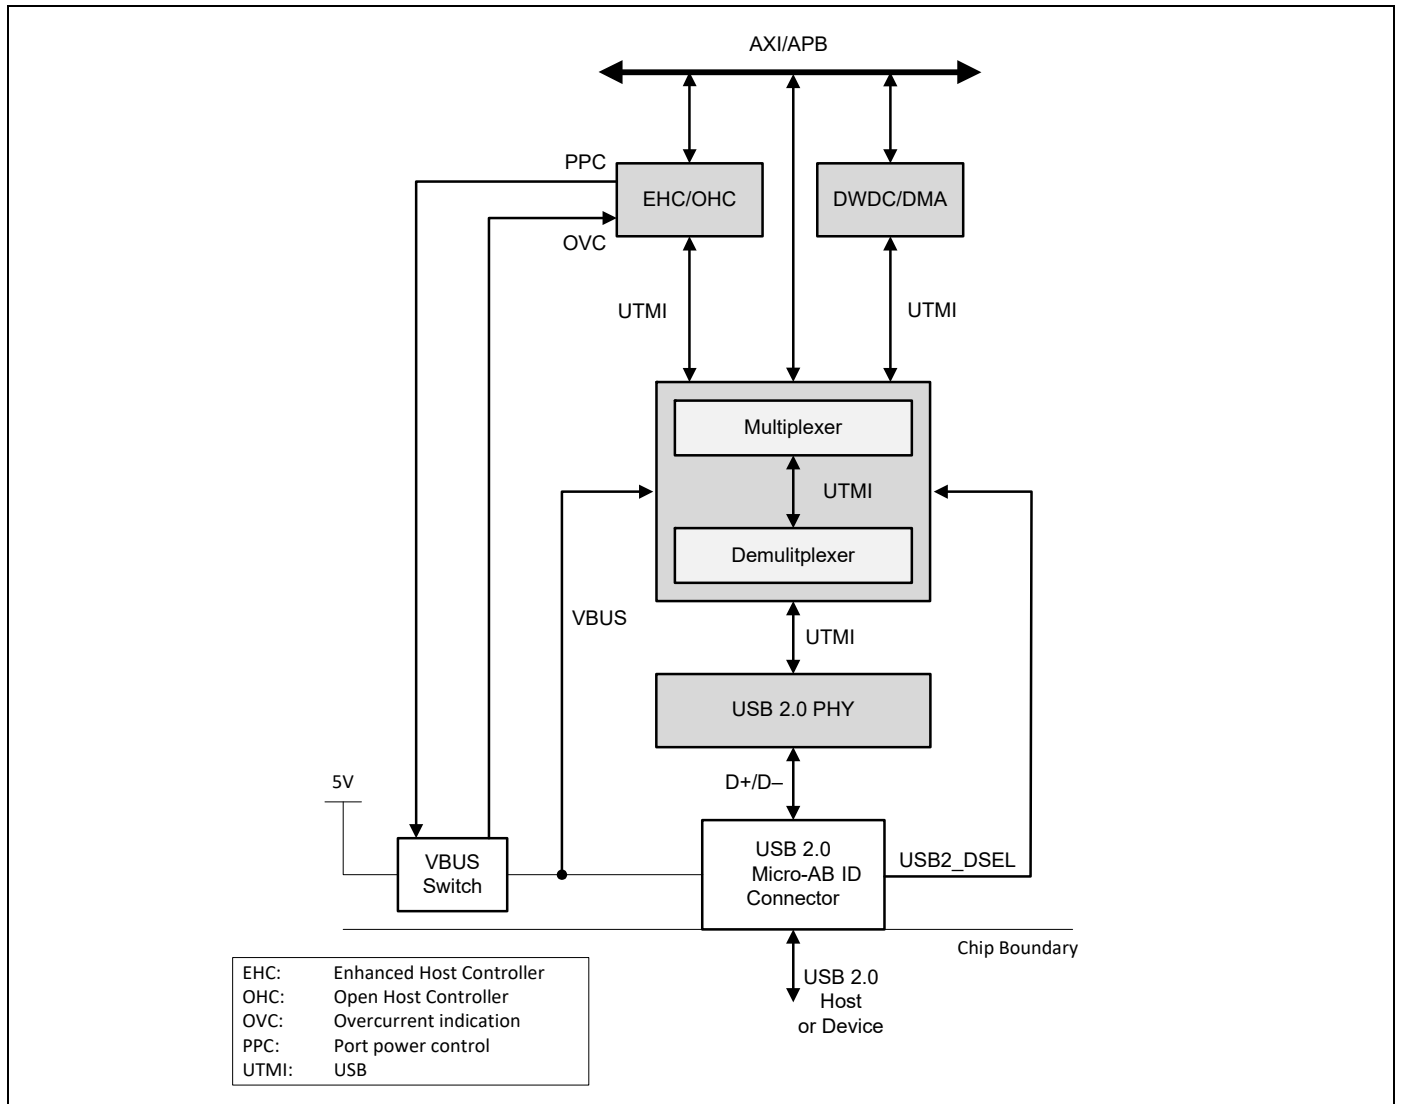

**Table 9. USB Application Cases**

Application Case Short-hand	Mode	PHY	USB2_DSEL	Connector Information
DRD + USB 2.0 PHY	DRD-Host	USB 2.0	0	Type: Micro-AB
	DRD-Device	USB 2.0	1	Connect USB2_DSEL to the ID pin of the Micro-AB receptacle.
Host + USB 2.0 PHY	Host	USB 2.0	0	Type A
Device + USB2.0 PHY	Device	USB 2.0	1	Type B

**Note:** In host mode, the USB core can process an overcurrent event and take the appropriate action. The overcurrent event is input into the CYW43907 via the alternative mode pin USB20H\_CTL.

Figure 10 shows the CYW43907 configured to operate in DRD mode with a USB 2.0 PHY.

**Figure 10. CYW43907 Configured as a DRD + USB 2.0 PHY**

The following information pertains to [Figure 10](#):

- The Micro-AB receptacle connects the CYW43907 to an external host or device.
- The Micro-AB connector ID pin is connected to the CYW43907 USB2\_DSEL pin.
- The CYW43907 GPIO\_9 pin is high in order to select the USB 2.0 PHY.
- The PPC line indicates whether the USB 2.0 host controller supports port power control.
- The OVC line is used to indicate an overcurrent condition.
- Standard differential signal lines D+ (DP) and D- (DM) are used for the USB 2.0 interface

#### 5.11.2 USB 2.0 Features

The following capabilities and features apply to the CYW43907 USB 2.0 PHY:

- Compliant with the UTMI+ level 2 specification.
- Functions as a host or device.
- Supports high speed (HS) at 480 Mbps, full speed (FS) at 12 Mbps, and low speed (LS) at 1.5 Mbps.
- Integrates pull-up and pull-down terminations with resistor support (per an engineering change notice to the USB 2.0 specification).
- Contains a calibrated 45Ω termination for HS TX/RX.
- Uses half-duplex differential data signaling with NRZI encoding.
- Recovers the data and clock from the data stream.
- Integrates a 960 MHz PLL with a single-ended reference clock.
- Supports host resume and remote wake-up.
- Supports L1 and L2 suspend, shallow sleep, and Link-Power Management (LPM).
- Supports legacy USB 1.1 devices through a serial interface.
- Supports dribble bits.
- Supports LS keep-alive packets (LS EOP).
- Support HS keep-alive packets (HS SYNC).
- Contains an onboard BERT for self-testing (PRBS and fixed patterns).
- Dissipates a maximum power of 150 mW for 1-port in loop-back mode.
- Contains an integrated 3.3V to 1.2V LDO.
- Uses 3.3V.

#### 5.12 SPI

CYW43907 contains 2 SPI blocks. These blocks support a fixed SPI mode (CPOL = 0, CPHA = 0) and 8-bit data read/write.

CPOL = 0: Clock idles at 0, and each cycle consists of a pulse of 1. The leading edge is a rising edge, and the trailing edge is a falling edge. CPHA = 0: The "out" side changes the data on the trailing edge of the preceding clock cycle, while the "in" side captures the data on (or shortly after) the leading edge of the clock cycle.

The SPI hardware blocks support a hold time of 25ns and a maximum clock frequency of 40MHz.

If a SPI slave does not support the above mode or requires a hold time greater than 25ns, a bit banging software SPI driver should be used. Cypress's WICED SDK provides an example of such a driver. Note that the maximum SPI frequency support by a software SPI driver is much lower than 40 MHz.

SPI0 mentioned in [Table 11](#) is multiplexed with GPIOs and can therefore support a bit banging based software SPI driver. SPI1 is not multiplexed with GPIOs and cannot support a bit banging based software SPI driver

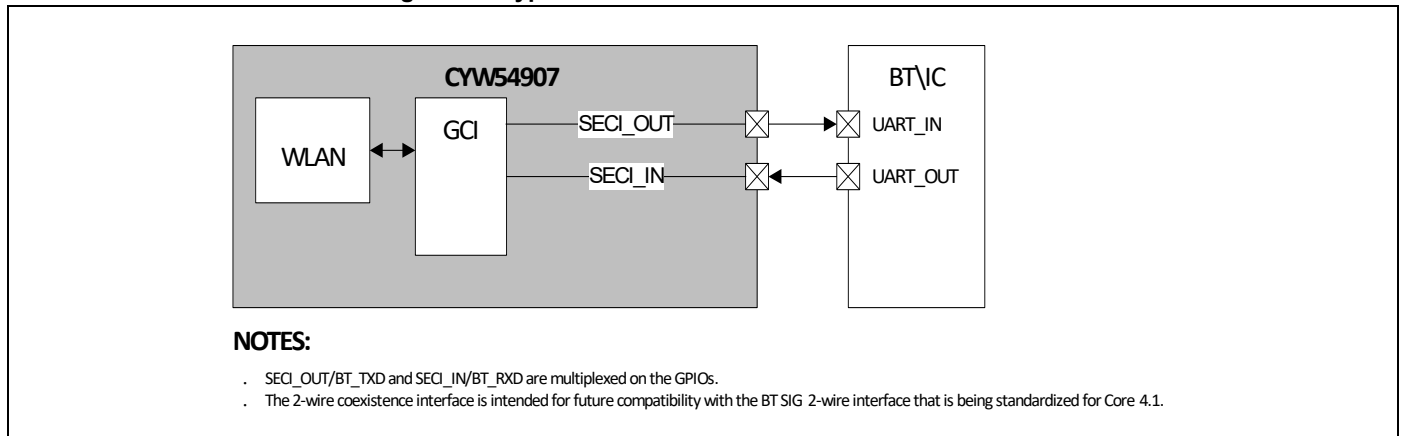

## 6. Global Functions

### 6.1 External Coexistence Interface

An external handshake interface is available to enable signaling between the device and an external colocated wireless device, such as Bluetooth, to manage wireless medium sharing for optimum performance.

Figure 11 shows the coexistence interface.

**Figure 11. Cypress 2-Wire External Coexistence Interface**

**Note:** SECI UART is the same as UART2, one of the low-speed UART interfaces mentioned in section 5.10 and in the reference schematics.

### 6.2 One-Time Programmable Memory

Various hardware configuration parameters can be stored in an internal 6144-bit (768 bytes) One-Time Programmable (OTP) memory that is read by system software after a device reset. In addition, customer-specific parameters, including the system vendor ID and MAC address can be stored, depending on the specific board design.

The initial state of all bits in an unprogrammed OTP memory device is 0. After any bit is programmed to a 1, it cannot be reprogrammed to 0. The entire OTP memory array can be programmed in a single write-cycle using a utility provided with the Cypress WLAN manufacturing test tools. Alternatively, multiple write cycles can be used to selectively program specific bytes, but only bits that are still in the 0 state can be altered during each programming cycle.

Prior to OTP memory programming, all values should be verified using the appropriate editable nvram.txt file. The nvram.txt file is provided with the reference board design package.

### 6.3 Hibernation Block

The Hibernation (HIB) block is a self-contained power domain that can be used to completely shut down the rest of the CYW43907. This optional block uses the HIB\_REG\_ON\_OUT pin to drive the REG\_ON pin. Therefore, for the HIB block to work as designed, the HIB\_REG\_ON\_OUT pin must be connected to the REG\_ON pin. To use the HIB block, software programs the HIB block with a wake count and then asserts a signal indicating that the chip should be put into hibernation. After assertion, the HIB block drives HIB\_REG\_ON\_OUT low for the number of 32 kHz clock cycles programmed as the wake count. After the wake-count timer expires, HIB\_REG\_ON\_OUT is driven high. Other than the logic state of the HIB block, no state is saved in the CYW43907 during hibernation.

#### 6.4 System Boot Sequence

The following general sequence occurs after a CYW43907 is powered on:

1. Either REG\_ON or HIB\_REG\_ON\_IN is asserted.

**Note:** For HIB\_REG\_ON\_IN to function as intended, HIB\_REG\_ON\_OUT must be connected to REG\_ON.

2. The core LDO (CLDO) and LDO3P3 outputs stabilize.
3. The OTP memory bits are used to initialize various functions, such as PMU trimming, package selection, memory size selection, etc.
4. The APP and WLAN cores are powered up.
5. The XTAL is powered up.
6. The APP and WLAN CPU bootup sequences start.

## 7. Wireless LAN Subsystem

### 7.1 WLAN CPU and Memory Subsystem

The CYW43907 WLAN section includes an integrated 32-bit ARM Cortex-R4 processor with internal RAM and ROM. The ARM Cortex-R4 is a low-power processor that features a low gate count, a small interrupt latency, and low-cost debug capabilities. It is intended for deeply embedded applications that require fast interrupt response features. Delivering more than a 30% performance gain over ARM7TDMI, the ARM Cortex-R4 implements the ARM v7-R architecture with support for the Thumb-2 instruction set.

At 0.19  $\mu\text{W}/\text{MHz}$ , the Cortex-R4 is the most power efficient general-purpose microprocessor available, outperforming 8- and 16-bit devices on MIPS/ $\mu\text{W}$ . It also supports integrated sleep modes.

On-chip memory for this CPU includes 576 KB of SRAM and 448 KB of ROM.

### 7.2 IEEE 802.11n MAC

The CYW43907 WLAN media access controller (MAC) is designed to support high-throughput operation with low power consumption. It does so without compromising the Bluetooth coexistence policies, thereby enabling optimal performance over both networks. In addition, several power-saving modes have been implemented that allow the MAC to consume very little power while maintaining network-wide timing synchronization. The architecture diagram of the MAC is shown in [Figure 12](#).

The following sections provide an overview of the important MAC modules.

**Figure 12. WLAN MAC Architecture**

The CYW43907 WLAN MAC supports features specified in the IEEE 802.11 base standard and amended by IEEE 802.11n. The key MAC features include:

- Transmission and reception of aggregated MPDUs (A-MPDU) for high throughput (HT).
- Support for power management schemes, including WMM power-save, power-save multi-poll (PSMP), and multiphase PSMP operation.
- Support for immediate ACK and Block-ACK policies.
- Interframe space timing support, including RIFS.
- Support for RTS/CTS and CTS-to-self frame sequences for protecting frame exchanges.
- Back-off counters in hardware for supporting multiple priorities as specified in the WMM specification.
- Timing synchronization function (TSF), network allocation vector (NAV) maintenance, and target beacon transmission time (TBTT) generation in hardware.
- Hardware offload for AES-CCMP, legacy WPA TKIP, legacy WEP ciphers, WAPI, and support for key management.
- Support for coexistence with Bluetooth and other external radios.
- Programmable independent basic service set (IBSS) or infrastructure basic service set functionality.
- Statistics counters for MIB support.

#### 7.2.1 PSM

The programmable state machine (PSM) is a microcoded engine that provides most of the low-level control to the hardware in order to implement the IEEE 802.11 specification. It is a microcontroller that is highly optimized for flow-control operations, which are predominant in implementations of communication protocols. The instruction set and fundamental operations are simple and general, allowing algorithms to be optimized very late in the design process. It also allows for changes to the algorithms to track evolving IEEE 802.11 specifications.

The PSM fetches instructions from microcode memory. It uses the shared memory to obtain operands for instructions, as a data store, and to exchange data between both the host and the MAC data pipeline (via the SHM bus). The PSM also uses a scratch-pad memory (similar to a register bank) to store frequently accessed and temporary variables.

The PSM exercises fine-grained control over the hardware engines by programming internal hardware registers (IHR). These IHRs are colocated with the hardware functions they control and are accessed by the PSM via the IHR bus.

The PSM fetches instructions from the microcode memory using an address determined by the program counter, instruction literal, or a program stack. For ALU operations, the operands are obtained from shared memory, scratch-pad memory, IHRs, or instruction literals, and the results are written into the shared memory, scratch-pad memory, or IHRs.

There are two basic branch instructions: conditional branches and ALU-based branches. To better support the many decision points in the IEEE 802.11 algorithms, branches can depend on either readily available signals from the hardware modules (branch condition signals are available to the PSM without polling the IHRs) or on the results of ALU operations.

#### 7.2.2 WEP

The wired equivalent privacy (WEP) engine encapsulates all the hardware accelerators to perform encryption and decryption as well as MIC computation and verification. The accelerators implement the following cipher algorithms: legacy WEP, WPA TKIP, WPA2 AES-CCMP.

The PSM determines, based on the frame type and association information, the appropriate cipher algorithm to use. It supplies the keys to the hardware engines from an on-chip key table. The WEP interfaces with the transmit engine (TXE) to encrypt and compute the MIC on transmit frames and the receive engine (RXE) to decrypt and verify the MIC on receive frames.

### 7.2.3 TXE

The transmit engine (TXE) constitutes the transmit data path of the MAC. It coordinates the DMA engines to store the transmit frames in the TXFIFO. It interfaces with the WEP module to encrypt frames and transfers the frames across the MAC-PHY interface at the appropriate time determined by the channel-access mechanisms.

The data received from the DMA engines are stored in transmit FIFOs. The MAC has multiple logical queues to support traffic streams that have different QoS priority requirements. The PSM uses the channel access information from the IFS module to schedule a queue from which the next frame is transmitted. Once the frame is scheduled, the TXE hardware transmits the frame based on a precise timing trigger received from the IFS module.

The TXE module also contains the hardware that allows the rapid assembly of MPDUs into an A-MPDU for transmission. The hardware module aggregates the encrypted MPDUs by adding appropriate headers and pad delimiters as needed.

### 7.2.4 RXE

The receive engine (RXE) constitutes the receive data path of the MAC. It interfaces with the DMA engine to drain the received frames from the RXFIFO. It transfers bytes across the MAC-PHY interface and interfaces with the WEP module to decrypt frames. The decrypted data is stored in the RXFIFO.

The RXE module contains filters that are programmed by the PSM to accept or filter frames based on several criteria such as receiver address, BSSID, and certain frame types.

The RXE module also contains the hardware required to detect A-MPDUs, parse the headers of the containers, and disaggregate them into component MPDUS.

### 7.2.5 IFS

The IFS module contains the timers required to determine interframe-space timing including RIFS timing. It also contains multiple backoff engines required to support prioritized access to the medium as specified by WMM.

The interframe-spacing timers are triggered by the cessation of channel activity on the medium, as indicated by the PHY. These timers provide precise timing to the TXE to begin frame transmission. The TXE uses this information to send response frames or perform transmit frame-bursting (RIFS or SIFS separated, as within a TXOP).

The backoff engines (for each access category) monitor channel activity, in each slot duration, to determine whether to continue or pause the backoff counters. When the backoff counters reach 0, the TXE gets notified so that it may commence frame transmission. In the event of multiple backoff counters decrementing to 0 at the same time, the hardware resolves the conflict based on policies provided by the PSM.

The IFS module also incorporates hardware that allows the MAC to enter a low-power state when operating under the IEEE power save mode. In this mode, the MAC is in a suspended state with its clock turned off. A sleep timer, whose count value is initialized by the PSM, runs on a slow clock and determines the duration over which the MAC remains in this suspended state. When the timer expires, the MAC is restored to its functional state. The PSM updates the TSF timer based on the sleep duration, ensuring that the TSF is synchronized to the network.

The IFS module also contains the PTA hardware that assists the PSM in Bluetooth coexistence functions.

### 7.2.6 TSF

The timing synchronization function (TSF) module maintains the TSF timer of the MAC. It also maintains the target beacon transmission time (TBTT). The TSF timer hardware, under the control of the PSM, is capable of adopting timestamps received from beacon and probe response frames in order to maintain synchronization with the network.

The TSF module also generates trigger signals for events that are specified as offsets from the TSF timer, such as uplink and downlink transmission times used in PSMP.

### 7.2.7 NAV

The network allocation vector (NAV) timer module is responsible for maintaining the NAV information conveyed through the duration field of MAC frames. This ensures that the MAC complies with the protection mechanisms specified in the standard.

The hardware, under the control of the PSM, maintains the NAV timer and updates the timer appropriately based on received frames. This timing information is provided to the IFS module, which uses it as a virtual carrier-sense indication.

**7.2.8 MAC-PHY Interface**

The MAC-PHY interface consists of a data path interface to exchange RX/TX data from/to the PHY. In addition, there is an programming interface that can be controlled either by the host or the PSM to configure and control the PHY.

**7.3 IEEE 802.11™ a/b/g/n PHY**

The CYW43907 WLAN digital PHY complies with IEEE 802.11a/b/g/n single-stream specifications to provide wireless LAN connectivity supporting data rates from 1 Mbps to 150 Mbps for low-power, high-performance, handheld applications.

The PHY has been designed to work in the presence of interference, radio nonlinearity, and various other impairments. It incorporates optimized implementations of filters, FFTs, and Viterbi-decoder algorithms. Efficient algorithms have been designed to achieve maximum throughput and reliability, including algorithms for carrier sensing and rejection, frequency/phase/timing acquisition and tracking, and channel estimation and tracking. The PHY receiver also contains a robust IEEE 802.11b demodulator. The PHY carrier-sensing algorithm provides high throughput for IEEE 802.11b/g hybrid networks with Bluetooth coexistence.

The key PHY features include:

- Programmable data rates from MCS0–7 in 20 MHz and 40 MHz channels.
- Support for Optional Short GI and Green Field modes in TX and RX.
- TX and RX LDPC for improved range and power efficiency.
- All scrambling, encoding, forward error correction, and modulation in the transmit direction and inverse operations in the receive direction.
- Support for IEEE 802.11h/k for worldwide operation.
- Advanced algorithms for low power consumption and enhanced sensitivity, range, and reliability.
- Algorithms to improve performance in the presence of externally received Bluetooth signals.
- An automatic gain control scheme for blocking and nonblocking cellular applications.
- Closed loop transmit power control.
- Digital RF chip calibration algorithms to handle CMOS RF chip process, voltage, and temperature (PVT) variations.
- On-the-fly channel frequency and transmit power selection.
- Per-packet RX antenna diversity.
- Available per-packet channel quality and signal-strength measurements.
- Compliance with FCC and other worldwide regulatory requirements.

**Figure 13. WLAN PHY Block Diagram**

## 8. WLAN Radio Subsystem

The CYW43907 includes an integrated dual-band WLAN RF transceiver that has been optimized for use in 2.4 GHz and 5 GHz Wireless LAN systems. It has been designed to provide low-power, low-cost, and robust communications for applications operating in the globally available 2.4 GHz unlicensed ISM or 5 GHz U-NII bands. The transmit and receive sections include all on-chip filtering, mixing, and gain control functions.

Ten RF control signals are available to drive external RF switches. In addition, these control signals can be used to support optional external 5 GHz band power and low-noise amplifiers. See the reference board schematics for more information.

A block diagram of the radio subsystem is shown in Figure 14. Note that integrated on-chip baluns (not shown) convert the fully differential transmit and receive paths to single-ended signal pins.

### 8.1 Receiver Path

The CYW43907 has a wide dynamic range, direct conversion receiver that employs high-order on-chip channel filtering to ensure reliable operation in the noisy 2.4 GHz ISM band or the entire 5 GHz U-NII band. The 2.4 GHz and 5 GHz paths each have a dedicated on-chip low-noise amplifier (LNA).

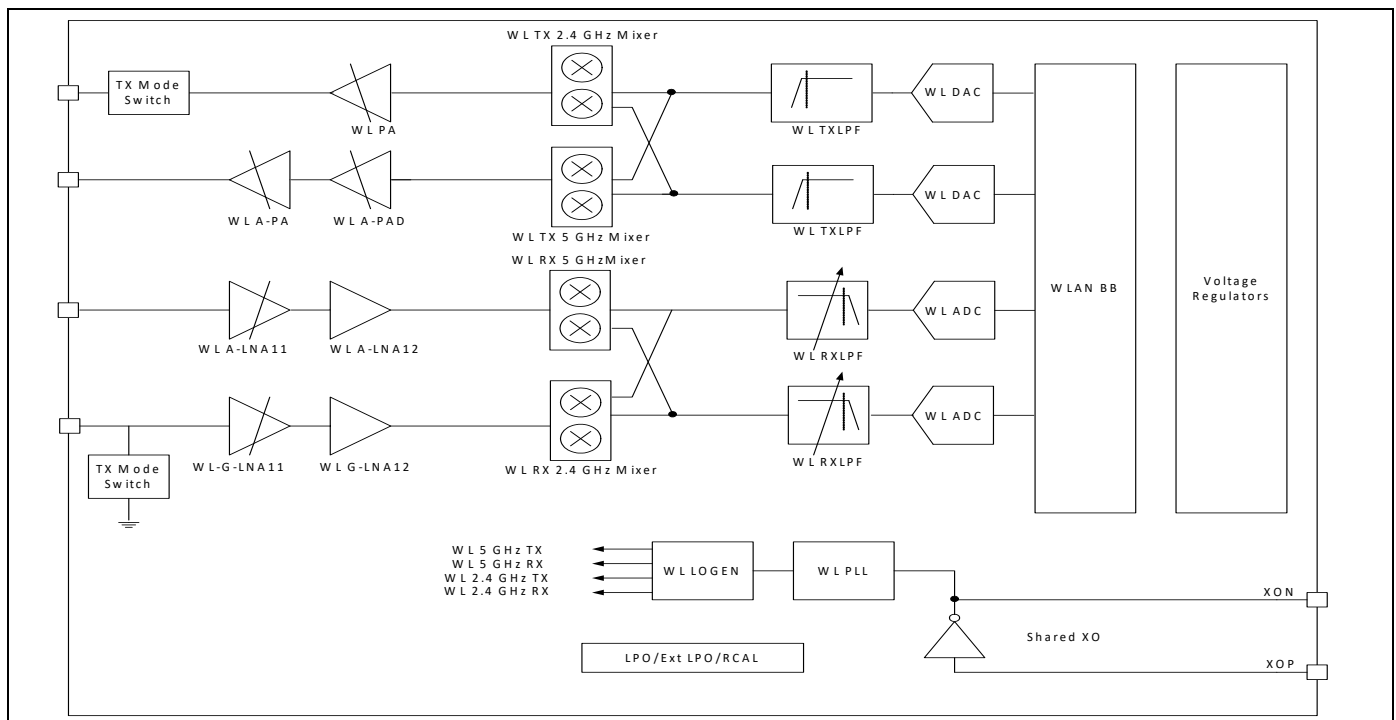

### 8.2 Transmit Path

Baseband data is modulated and upconverted to the 2.4 GHz ISM or 5 GHz U-NII bands, respectively. Linear on-chip power amplifiers deliver high output powers while meeting IEEE 802.11a/b/g/n specifications without the need for external PAs. When using the internal PA, which is required in the 2.4 GHz band and optional in the 5 GHz band, closed-loop output power control is completely integrated.

### 8.3 Calibration

The CYW43907 features dynamic and automatic on-chip calibration to continually compensate for temperature and process variations across components. These calibration routines are performed periodically during the course of normal radio operation. Examples of some of the automatic calibration algorithms are baseband filter calibration for optimum transmit and receive performance and LOFT calibration for carrier leakage reduction. In addition, I/Q calibration and VCO calibration are performed on-chip. No per-board calibration is required during manufacturing testing. This helps to minimize the test time and cost in large-volume production environments.

## 9.2 Signal Descriptions

Table 11 provides the signal name, type, and description for each CYW43907 bump. The symbols shown under Type indicate pin directions (I/O = bidirectional, I = input, and O = output) and the internal pull-up/pull-down characteristics (PU = weak internal pull-up resistor and PD = weak internal pull-down resistor), if any.

**Table 11. Signal Descriptions**

Bump Number	Signal Name	Type	Description
<b>Cypress Serial Control (CSC) Interfaces</b>			
92	I2C0_CLK	O	CSC master clock.
93	I2C0_SDATA	I/O	CSC serial data
89	I2C1_CLK	O	CSC master clock
90	I2C1_SDATA	I/O	CSC serial data
<b>Clocks</b>			
222	WRF_XTAL_XOP	I	XTAL oscillator input.
226	WRF_XTAL_XON	O	XTAL oscillator output.
213	LPO_XTAL_IN	I	External sleep clock input (32.768 kHz).
249	HIB_XTALIN	I	3.3V 32 kHz crystal input

**Table 11. Signal Descriptions (Cont.)**

Bump Number	Signal Name	Type	Description
250	HIB_XTALOUT	O	3.3V 32 kHz crystal output

**Table 11. Signal Descriptions (Cont.)**

Bump Number	Signal Name	Type	Description
6, 14, 15, 21, 22, 25, 35, 39, 40, 42, 50, 52, 53, 56–60, 79, 96, 104, 135, 177, 178, 182, 183, 197, 209, 210, 248, 251, 253, 256, 259, 260, 262, 264–266, 272–274, 287, 290–292, 301, 302, 308, 313, 315	VSSC	GND	Core ground for WLAN and APP sections
110, 111, 123, 124	SR_PVSS	GND	Power ground
97	PMU_AVSS	GND	Quiet ground
212	AVSS	GND	Baseband PLL ground
191	AVSS_AUDIO	GND	AUDIO PLL ground
168	USB2_AVSS	GND	USB 2.0 analog ground
172	USB2_AVSSBG	GND	USB 2.0 analog ground
171	USB2_DVSS	GND	USB 2.0 digital ground
<b>Hibernation Block, Power-Down/Power-Up, and Reset</b>			
100	REG_ON	I	Used by PMU to power up or power down the internal CYW43907 regulators used by the WLAN and APP sections. Also, when deasserted, this pin holds the WLAN and APP sections in reset. This pin has an internal 200 kΩ pull-down resistor that is enabled by default. It can be disabled through programming.
282	HIB_REG_ON_IN	I	Used by the hibernation block to power up or power down the internal CYW43907 regulators. For applications that use the hibernation block, HIB_REG_ON_OUT must connect to REG_ON. Also, when deasserted, this pin holds the WLAN and APP sections in reset.
278	HIB_REG_ON_OUT	O	REG_ON output signal generated by the hibernation block.
279	HIB_WAKE_B	I	Wake up chip from hibernation mode.
283	HIB_LPO_SELMODE	I	Select precise or coarse 32 kHz clock.
198	SRSTN	I	System reset. This active-low signal resets the backplanes.
<b>I<sup>2</sup>S Interface</b>			
153	I2S_MCLK0	I/O	M clock
154	I2S_SCLK0	I/O	S clock
163	I2S_LRCLK0	I/O	LR clock
164	I2S_SDATAI0	I	I <sup>2</sup> S data input
161	I2S_SDATAO0	O	I <sup>2</sup> S data output
158	I2S_MCLK1	I/O	M clock
160	I2S_SCLK1	I/O	S clock
162	I2S_LRCLK1	I/O	LR clock
156	I2S_SDATAI1	I	I <sup>2</sup> S data input
155	I2S_SDATAO1	O	I <sup>2</sup> S data output
<b>JTAG Interface</b>			
193	JTAG_SEL	I	JTAG select. This pin must be connected to ground if the JTAG interface is not used.

**Table 11. Signal Descriptions (Cont.)**

Bump Number	Signal Name	Type	Description
<b>No Connects</b>			
1–5, 7–13, 16–20, 23, 24, 26–34, 36–38, 41, 43–49, 51, 54, 55, 61–70, 179–181	NO_CONNECT	–	No connect
<b>Power Supplies (Miscellaneous)</b>			
203	OTP_VDD3P3	PWR	OTP 3.3V supply
138, 216, 217, 252, 254, 267, 268, 271, 275–277, 280, 281, 285, 286, 289, 309, 314, 316	VDDC	PWR	1.2V core supply for WLAN
105, 174, 195, 257, 258, 261, 263, 269	VDDIO	PWR	I/O supply
199, 208	VDDIO_RF	PWR	I/O supply for RF switch control pads (3.3V).
157, 159	VDDIO_I2S	PWR	I/O supply for I <sup>2</sup> S
305, 307	VDDIO_RMII	PWR	I/O supply for RMII
255	VDDIO_SD	PWR	I/O supply for SDIO
270	HIB_VDDO	PWR	I/O supply for hibernation block
204	AVDD1P2	PWR	1.2V supply for baseband PLL
192	AVDD1P2_AUDIO	PWR	1.2V supply for audio PLL
166	USB2_AVDD33	PWR	3.3V supply for USB 2.0
173	USB2_AVDD33LDO	PWR	3.3V supply for USB 2.0
176	USB2_AVDD33IO	PWR	3.3V supply for USB 2.0
<b>Power Supplies (WLAN)</b>			
223	WRF_SYNTH_VDD3P3	PWR	Synthesizer VDD 3.3V supply
240, 241	WRF_PA_VDD3P3	PWR	2.4 GHz and 5 GHz PA 3.3V VBAT supply
227, 228	WRF_PMU_VDD1P35	PWR	PMU 1.35V supply
244	WRF_TXMIX_VDD	PWR	3.3V supply for TX mixer
229	WRF_SYNTH_VDD1P2	PWR	1.2V supply for synthesizer
231	WRF_AFE_VDD1P35	PWR	1.35V supply for the analog front end (AFE)
<b>PWM Interface</b>			
185	PWM0	O	Pulse width modulation bit 0.
186	PWM1	O	Pulse width modulation bit 1
190	PWM2	O	Pulse width modulation bit 2
189	PWM3	O	Pulse width modulation bit 3
187	PWM4	O	Pulse width modulation bit 4
188	PWM5	O	Pulse width modulation bit 5
<b>RF Signal Interface (WLAN)</b>			
246	WRF_RFIN_2G	I	2.4 GHz WLAN receiver input
233	WRF_RFIN_5G	I	5 GHz WLAN receiver input
245	WRF_PAOUT_2G	O	2.4 GHz WLAN PA output
239	WRF_PAOUT_5G	O	5 GHz WLAN PA output
235	WRF_EXT_TSSIA	I	5 GHz TSSI input from an optional external power amplifier/power detector
237	WRF_GPAIO_OUT	I/O	Analog GPIO

**Table 11. Signal Descriptions (Cont.)**

Bump Number	Signal Name	Type	Description
<b>RF Switch Control Lines</b>			
215	RF_SW_CTRL_0	O	Programmable RF switch control lines. The control lines are programmable via the driver and nvram.txt file.
214	RF_SW_CTRL_1	O	
211	RF_SW_CTRL_2	O	
205	RF_SW_CTRL_3	O	
206	RF_SW_CTRL_4	O	
207	RF_SW_CTRL_5	I/O	
202	RF_SW_CTRL_6	I/O	
201	RF_SW_CTRL_7	I/O	
200	RF_SW_CTRL_8	I/O	
196	RF_SW_CTRL_9	I/O	
<b>SDIO Interface</b>			
152	SDIO_CLK	I/O	SDIO clock
151	SDIO_CMD	I/O	SDIO command line
150	SDIO_DATA_0	I/O	SDIO data line 0
149	SDIO_DATA_1	I/O	SDIO data line 1
148	SDIO_DATA_2	I/O	SDIO data line 2
147	SDIO_DATA_3	I/O	SDIO data line 3
<b>S/PDIF Interface</b>			
<b>Note:</b> Supported via 161 (I2S_SDATA0) and 155 (I2S_SDATA1).			
<b>SPI Flash Interface</b>			
77	SFL_CLK	O	Flash clock
73	SFL_IO0	I/O	Flash data
71	SFL_IO1	I/O	Flash data
75	SFL_IO2	I/O	Flash data
72	SFL_IO3	I/O	Flash data
74	SFL_CS	O	Flash slave select
<b>SPI Interfaces</b>			
<b>Note:</b> Each SPI interface can alternatively be configured and used as a CSC interface <sup>a</sup> .			
76	SPI0_CLK	O	SPI clock
78	SPI0_MISO	I	SPI data master in
81	SPI0_SISO	O	SPI data master out
82	SPI0_CS	O	SPI slave select
83	SPI1_CLK	O	SPI clock
84	SPI1_MISO	I	SPI data master in
86	SPI1_SISO	O	SPI data master out
80	SPI1_CS	O	SPI slave select
<b>UART Interface</b>			
85	UART0_CTS	I	UART clear-to-send
91	UART0_RTS	O	UART request-to-send
88	UART0_RXD	I	UART serial input
87	UART0_TXD	O	UART serial output

**Table 11. Signal Descriptions (Cont.)**

Bump Number	Signal Name	Type	Description
<b>USB 2.0</b>			
170	USB2_DM	I/O	USB 2.0 data
167	USB2_DP	I/O	USB 2.0 data
169	USB2_RREF	I	USB 2.0 reference resistor connection
175	USB2_MONCDR	O	USB 2.0 CDR monitor
184	USB2_MONPLL	O	USB 2.0 PLL monitor
165	USB2_DSEL	I	USB 2.0 host and device mode selection
<b>Voltage Regulators (Integrated)</b>			
108, 113, 122, 125	SR_VDDBAT5V	I	VBAT.
98, 99, 101, 102, 109, 112	SR_VLX	O	CBUCK switching regulator output
115, 116, 120, 127	LDO_VDD1P5	I	LNLDO input
128, 129	LDO_VDDBAT5V	I	LDO VBAT
221	WRF_XTAL_VDD1P35	I	XTAL LDO input (1.35V)
220	WRF_XTAL_VDD1P2	O	XTAL LDO output (1.2V)
106	VOUT_LNLDO	O	Output of LNLDO
114, 121, 126	VOUT_CLDO	O	Output of core LDO
118, 119	VOUT_3P3	O	LDO 3.3V output
117	VOUT_3P3_SENSE	O	Voltage sense pin for LDO 3.3V output
103	VOUT_CLDO_SENSE	O	Voltage sense pin for core LDO
107	VOUT_BBPLLOUT	O	Output of baseband PLL

a. The SPI blocks can be re-purposed as I2C, however the WICED SDK does not support this. Certain I2C features are not available when using the SPI blocks as I2C. Therefore Cypress does not recommend using the SPI blocks as I2C interfaces.

## 10. GPIO Signals and Strapping Options

### 10.1 Overview

This section describes GPIO signals and strapping options. The pins are sampled at power-on reset (POR) to determine various operating modes. Sampling occurs a few milliseconds after an internal POR or deassertion of the external POR. After the POR, each pin assumes the GPIO or alternative function specified in [Table 13](#). Each strapping option pin has an internal pull-up (PU) or pull-down (PD) resistor that determines the default mode. To change the mode, connect an external PU resistor to VDDIO or a PD resistor to ground, using a 10 kΩ resistor or less.

**Note:** Refer to the reference board schematics for more information.

### 10.2 Weak Pull-Down and Pull-Up Resistances

At VDDO = 3.3V ±10%, the minimum, typical, and maximum weak pull-down resistances (for a pin voltage of VDDO) are 37.99 kΩ, 44.57 kΩ, and 51.56 kΩ, respectively. At VDDO = 0V, the minimum, typical, and maximum weak pull-up resistances (for a pin voltage of 0V) are 34.73 kΩ, 39.58 kΩ, and 44.51 kΩ, respectively.

### 10.3 Strapping Options

[Table 12](#) provides the strapping options.

**Table 12. Strapping Options**

Pin Name	Strap	Bump #	Default Internal Pull During Strap	Description
GPIO_1	GSPI_MODE	142	PD	Enable gSPI interface
GPIO_7	WCPU_BOOT_MODE	95	PD	Boot from SoC SROM or SoC SRAM
GPIO_11	ACPU_BOOT_MODE	140	PD	Boot from tightly coupled memory (TCM) ROM or TC
GPIO_13	SDIO_MODE	131	PD	Select either SDIO host mode or SDIO device mode
GPIO_15	VTRIM_EN	145	PD	Enable PMU voltage trimming
RF_SW_CTRL_5	DAP_CLK_SEL	207	PD	Select XTAL clock or the test clock (tck) for the debu
RF_SW_CTRL_7	RSRC_INIT_MODE	201	PD	PMU resource initialization mode selection

### 10.4 Alternate GPIO Signal Functions

Table 13 provides the alternate signal functions of the GPIO signals.

**Table 13. Alternate GPIO Signal Functions**

GPIO	Default	JTAG_SEL	Default Pull	HOLD/PDLOW/PDHIGH	Strap	Comments
GPIO_0	USB20H_CTL	-	No pull	HOLD	-	8 mA
GPIO_1	-	-	Down	HOLD	GSPI_MODE	8 mA
GPIO_2	GCI_GPIO(0)	JTAG_TCK	No pull	HOLD	-	8 mA
GPIO_3	GCI_GPIO(1)	JTAG_TMS	No pull	HOLD	-	8 mA
GPIO_4	GCI_GPIO(2)	JTAG_TDI	No pull	HOLD	-	8 mA
GPIO_5	GCI_GPIO(3)	JTAG_TDO	No pull	HOLD	-	8 mA
GPIO_6	GCI_GPIO(4)	JTAG_TRST	No pull	HOLD	-	8 mA
GPIO_7	-	-	Down	HOLD	WCPU_BOOT_MODE	8 mA
GPIO_8	GPIO_8	-	No pull	HOLD	-	8 mA
GPIO_9	GPIO_9	-	Down	HOLD	-	8 mA
GPIO_10	GPIO_10	-	No pull	HOLD	-	8 mA
GPIO_11	-	-	Down	HOLD	ACPU_BOOT_MODE	8 mA
GPIO_12	GPIO_12	-	No pull	HOLD	-	8 mA
GPIO_13	-	-	Down	HOLD	SDIO_MODE	8 mA
GPIO_14	GPIO_14	-	No pull	HOLD	-	8 mA
GPIO_15	-	-	Down	HOLD	VTRIM_EN	8 mA
GPIO_16	-	-	No pull	HOLD	-	8 mA

## 11. Pin Multiplexing

Table 14 shows the pin multiplexing functions.

**Table 14. Pin Multiplexing**

Pin	Function										
	1	2	3	4	5	6	7	8	9	10	11
GPIO_0	GPIO_0	UART0_RXD	I2C1_SDATA	PWM0	SPI1_MISO	PWM2	GPIO_12	GPIO_8	-	PWM4	USB20H_CTL

a. UART\_DBG\_TX and UART\_DBG\_RX are for UART1 mentioned in section 5.10 and in the reference schematics. SECI\_IN and SECI\_OUT are for UART2 mentioned in section 5.10 and in the reference schematics.

## 12. I/O States

Table 15 provides I/O state information for the signals listed.

The following notations are used in Table 15:

- I: Input signal
- O: Output signal
- I/O: Input/Output signal
- PU = Pulled up
- PD = Pulled down
- NoPull = Neither pulled up nor pulled down

**Table 15. I/O States**

Ball Name	I/O	Keeper <sup>a</sup>	Active Mode	Low Power State/Sleep (All Power Present)	Power-down <sup>b</sup> (REG_ON Held Low)	Out-of-Reset; Before Software Download (REG_ON High)	Power Rail
HIB_REG_ON_IN	I	N	Input; PD (Pull-down can be disabled.)	Input; PD (Pull-down can be disabled.)	Input	Input	-
REG_ON	I	N	Input; PD (Pull-down can be disabled.)	Input; PD (Pull-down can be disabled.)	Input; PD (of 200 kΩ)	Input; PD (of 200 kΩ)	-
CLK_REQ	I/O	Y	Open drain or push-pull (programmable). Active high.	Open drain or push-pull (programmable). Active high.	High-Z; NoPull	Open drain; active high	VDDO
GPIO_0	I/O	Y	Input/Output; PU, PD, or NoPull (programmable [Default: PD])	Input/Output; PU, PD, or NoPull (programmable [Default: PD])	High-Z; NoPull	Input; PD	VDDIO
GPIO_1	I/O	Y	Input/Output; PU, PD, or NoPull (programmable [Default: NoPull])	Input/Output; PU, PD, or NoPull (programmable [Default: NoPull])	High-Z; NoPull	Input; NoPull	VDDIO
GPIO_2	I/O	Y	Input/Output; PU, PD, or NoPull (programmable [Default: NoPull])	Input/Output; PU, PD, or NoPull (programmable [Default: NoPull])	High-Z; NoPull	Input; NoPull	VDDIO
GPIO_3	I/O	Y	Input/Output; PU, PD, or NoPull (programmable [Default: PD])	Input/Output; PU, PD, or NoPull (programmable [Default: PD])	High-Z; NoPull	Input; PD	VDDIO
GPIO_4	I/O	Y	Input/Output; PU, PD, or NoPull (programmable [Default: NoPull])	Input/Output; PU, PD, or NoPull (programmable [Default: NoPull])	High-Z; NoPull	Input; NoPull	VDDIO
GPIO_5	I/O	Y	Input/Output; PU, PD, or NoPull (programmable [Default: PD])	Input/Output; PU, PD, or NoPull (programmable [Default: PD])	High-Z; NoPull	Input; PD	VDDIO

**Table 15. I/O States**

Ball Name	I/O	Keeper <sup>a</sup>	Active Mode	Low Power State/Sleep (All Power Present)	Power-down <sup>b</sup> (REG_ON Held Low)	Out-of-Reset; Before Software Download (REG_ON High)	Power Rail
GPIO_6	I/O	Y	Input/Output; PU, PD, or NoPull (programmable [Default: NoPull])	Input/Output; PU, PD, or NoPull (programmable [Default: NoPull])	High-Z, NoPull	Input; NoPull	VDDIO
GPIO_7	I/O	Y	Input/Output; PU, PD, or NoPull (programmable [Default: NoPull])	Input/Output; PU, PD, or NoPull (programmable [Default: NoPull])	High-Z, NoPull	Input; NoPull	VDDIO
GPIO_8	I/O	Y	Input/Output; PU, PD, or NoPull (programmable [Default: PD])	Input/Output; PU, PD, or NoPull (programmable [Default: PD])	High-Z, NoPull	Input; PD	VDDIO
GPIO_9	I/O	Y	Input/Output; PU, PD, or NoPull (programmable [Default: PD])	Input/Output; PU, PD, or NoPull (programmable [Default: PD])	High-Z, NoPull	Input; PD	VDDIO
GPIO_10	I/O	Y	Input/Output; PU, PD, or NoPull (programmable [Default: NoPull])	Input/Output; PU, PD, or NoPull (programmable [Default: NoPull])	High-Z, NoPull	Input; NoPull	VDDIO
GPIO_11	I/O	Y	Input/Output; PU, PD, or NoPull (programmable [Default: PD])	Input/Output; PU, PD, or NoPull (programmable [Default: PD])	High-Z, NoPull	Input; PD	VDDIO
GPIO_12	I/O	Y	Input/Output; PU, PD, or NoPull (programmable [Default: NoPull])	Input/Output; PU, PD, or NoPull (programmable [Default: NoPull])	High-Z, NoPull	Input; NoPull	VDDIO
GPIO_13	I/O	Y	Input/Output; PU, PD, or NoPull (programmable [Default: NoPull])	Input/Output; PU, PD, or NoPull (programmable [Default: NoPull])	High-Z, NoPull	Input; NoPull	VDDIO
GPIO_14	I/O	Y	Input/Output; PU, PD, or NoPull (programmable [Default: NoPull])	Input/Output; PU, PD, or NoPull (programmable [Default: NoPull])	High-Z, NoPull	Input; NoPull	VDDIO
GPIO_15	I/O	Y	Input/Output; PU, PD, or NoPull (programmable [Default: NoPull])	Input/Output; PU, PD, or NoPull (programmable [Default: NoPull])	High-Z, NoPull	Input; NoPull	VDDIO
GPIO_16	I/O	Y	Input/Output; PU, PD, or NoPull (programmable [Default: NoPull])	Input/Output; PU, PD, or NoPull (programmable [Default: NoPull])	High-Z, NoPull	Input; NoPull	VDDIO
RF_SW_CTRL (0 to 9)	I/O	Y	Output; NoPull	Output; NoPull	High-Z	Output; NoPull	VDDIO_RF

a. Keeper column: N = pad has no keeper. Y = pad has a keeper. Keeper is always active except in power-down state. If there is no keeper, and it is an input and there is NoPull, then the pad should be driven to prevent leakage due to floating pad (WL\_REG\_ON, for example).

b. In the power-down state (xx\_REG\_ON=0): High-Z, NoPull => the pad is disabled because power is not supplied.

### 13. Electrical Characteristics

**Note:** Values in this data sheet are design goals and are subject to change based on the results of device characterization.

#### 13.1 Absolute Maximum Ratings

**Caution!** The absolute maximum ratings in [Table 16](#) indicate levels where permanent damage to the device can occur, even if these limits are exceeded for only a brief duration. Functional operation is not guaranteed under these conditions. Operation at absolute maximum conditions for extended periods can adversely affect long-term reliability of the device.

**Table 16. Absolute Maximum Ratings**

Parameter	Symbol	Value	Unit
DC supply for VBAT and PA driver supply <sup>a</sup>	VBAT	-0.5 to +5.5	V
DC supply voltage for digital I/O	VDDIO	-0.5 to 3.9	V
DC supply voltage for I <sup>2</sup> S I/O	VDDIO_I2S	-0.5 to 3.9	V
DC supply voltage for RF switch I/O	VDDIO_RF	-0.5 to 3.9	V
DC supply voltage for Ethernet I/O	VDDIO_RMII	-0.5 to 3.9	V
DC supply voltage for SDIO I/O	VDDIO_SD	-0.5 to 3.9	V
DC input supply voltage for CLDO, LNLDO, and BBPLL LDO <sup>b</sup>	-	-0.5 to 1.575	V
3.3V DC supply for USB	USB2_AVDD33 USB2_AVDD33LDO USB2_AVDD33IO	-0.5 to 3.9	V
3.3V DC supply voltage for RF analog <sup>c</sup>	VDD3P3RF	-0.5 to 3.6	V
1.35V DC supply voltage for RF analog <sup>d</sup>	VDD1P35RF	-0.5 to 1.5	V
1.2V DC supply voltage for RF analog <sup>e</sup>	VDD1P2RF	-0.5 to 1.26	V
1.2V DC supply voltage for analog circuits <sup>f</sup>	VDD1P2A	-0.5 to 1.26	V
DC supply voltage for the core <sup>g</sup>	VDDC	-0.5 to 1.32	V
DC supply voltage for OTP memory	OTP_VDD3P3	-0.5 to 3.9	V
Maximum undershoot voltage for I/O	V <sub>undershoot</sub>	-0.5	V
Maximum junction temperature	T <sub>J</sub>	125	°C

a. For the SR\_VDDBAT5V and LDO\_VDDBAT5V supplies.

b. For the LDO\_VDD1P5 and WRF\_XTAL\_VDD1P35 supplies.

c. For the WRF\_SYNTH\_VDD3P3, WRF\_PA\_VDD3P3, and WRF\_TXMIX\_VDD supplies.

d. For WRF\_PMU\_VDD1P35 and WRF\_AFE\_VDD1P35 supplies.

e. For the WRF\_SYNTH\_VDD1P2 supply.

f. For the AVDD1P2\_AUDIO, AVDD1P2, and HSIC\_AVDD12 supplies.

g. For the VDD, HSIC\_DVDD12, and HSIC2\_DVDD2 supplies.

### 13.2 Environmental Ratings

The environmental ratings are shown in [Table 17](#).

**Table 17. Environmental Ratings**

Characteristic	Value	Units	Conditions/Comments
Ambient temperature (T <sub>A</sub> )	-30 to +85	°C	Functional operation
Storage temperature	-40 to +125	°C	–
Relative humidity	Less than 60	%	Storage
	Less than 85	%	Operation

### 13.3 Electrostatic Discharge Specifications

Extreme caution must be exercised to prevent electrostatic discharge (ESD) damage. Proper use of wrist and heel grounding straps to discharge static electricity is required when handling these devices. Always store unused material in its antistatic packaging.

**Table 18. ESD Specifications**

Pin Type	Symbol	Condition	ESD Rating	Unit
ESD	ESD_HAND_HBM	Human body model contact discharge per JEDEC EID/ JESD22-A114	1.5 k	V
CDM	ESD_HAND_CDM	Charged device model contact discharge per JEDEC EIA/ JESD22-C101	250	V

### 13.4 Recommended Operating Conditions and DC Characteristics

**Caution!** Functional operation is not guaranteed outside of the limits shown in [Table 19](#). Operation outside these limits for extended periods can adversely affect long-term reliability of the device.

**Table 19. Recommended Operating Conditions and DC Characteristics**

Parameter	Symbol	Value			Unit
		Minimum	Typical	Maximum	
DC supply voltage for VBAT	VBAT	2.3 <sup>a</sup>	3.6	4.8	V
DC supply voltage for digital I/O	VDDIO	1.71	–	3.63	V
DC supply voltage for I <sup>2</sup> S I/O	VDDIO_I2S	1.71	–	3.63	V
DC supply voltage for RF switch I/Os	VDDIO_RF <sup>b</sup>	3.13	3.3	3.6	V
DC supply voltage for Ethernet I/O	VDDIO_RMII	1.71	–	3.63	V
DC supply voltage for SDIO I/O	VDDIO_SD	1.71	–	3.63	V
DC input supply voltage for CLDO, LNLDO, and BBPLL LDO	–	1.3	1.35	1.5	V
3.3V DC supply for USB	USB2_AVDD33 USB2_AVDD33LDO USB2_AVDD33IO	2.97	3.3	3.63	V
3.3V DC supply voltage for RF analog	VDD3P3RF <sup>c</sup>	3	3.3	3.45	V
1.35V DC supply voltage for RF analog	VDD1P35RF <sup>c</sup>	1.3	1.35	1.5	V
1.2V DC supply voltage for RF analog	VDD1P2RF <sup>c</sup>	1.1	1.2	1.26	V
1.2V DC supply voltage for analog	VDD1P2A <sup>c</sup>	1.1	1.2	1.26	V
DC supply voltage for core	VDDC	1.14	1.2	1.26	V
DC supply voltage for OTP memory	OTP_VDD3P3 <sup>b</sup>	2.97	3.3	3.63	V
DC supply voltage for TCXO input buffer	WRF_TCXO_VDD <sup>c</sup>	1.62	1.8	1.98	V

**Table 19. Recommended Operating Conditions and DC Characteristics (Cont.)**

Parameter	Symbol	Value			Unit
		Minimum	Typical	Maximum	
Internal POR threshold	V <sub>th_POR</sub>	0.4	–	0.7	V
<b>SDIO Interface I/O Pins</b>					
For VDDIO_SD = 1.8V:					
Input high voltage	V <sub>IH</sub>	1.27	–	–	V
Input low voltage	V <sub>IL</sub>	–	–	0.58	V
Output high voltage @ 2 mA	V <sub>OH</sub>	1.40	–	–	V
Output low voltage @ 2 mA	V <sub>OL</sub>	–	–	0.45	V
For VDDIO_SD = 3.3V:					
Input high voltage	V <sub>IH</sub>	0.625 × VDDIO	–	–	V
Input low voltage	V <sub>IL</sub>	–	–	0.25 × VDDIO	V
Output high voltage @ 2 mA	V <sub>OH</sub>	0.75 × VDDIO	–	–	V
Output low voltage @ 2 mA	V <sub>OL</sub>	–	–	0.125 × VDDIO	V
<b>Other Digital I/O Pins</b>					
For VDDIO = 1.8V:					
Input high voltage	V <sub>IH</sub>	0.65 × VDDIO	–	–	V
Input low voltage	V <sub>IL</sub>	–	–	0.35 × VDDIO	V
Output high voltage @ 2 mA	V <sub>OH</sub>	VDDIO – 0.45	–	–	V
Output low voltage @ 2 mA	V <sub>OL</sub>	–	–	0.45	V
For VDDIO = 3.3V:					
Input high voltage	V <sub>IH</sub>	2.00	–	–	V
Input low voltage	V <sub>IL</sub>	–	–	0.80	V
Output high voltage @ 2 mA	V <sub>OH</sub>	VDDIO – 0.4	–	–	V
Output low voltage @ 2 mA	V <sub>OL</sub>	–	–	0.40	V
<b>RF Switch Control Output Pins<sup>d</sup></b>					
For VDDIO_RF = 3.3V:					
Output high voltage @ 2 mA	V <sub>OH</sub>	VDDIO – 0.4	–	–	V
Output low voltage @ 2 mA	V <sub>OL</sub>	–	–	0.40	V
Input capacitance	C <sub>IN</sub>	–	–	5	pF

- a. The CYW43907 is functional across this range of voltages. Optimal RF performance specified in the data sheet, however, is guaranteed only for 3V < VBAT < 4.8V.
- b. VDD3P3RF, which is an internally generated supply, can drive this node. There is sufficient current and the appropriate state is maintained during hibernation and sleep cycles.
- c. Internally generated supply.
- d. Programmable 2 mA to 16 mA drive strength. Default is 10 mA.

### 13.5 Power Supply Segments

The digital I/O's are placed in physical segments. The supply voltage for each segment can be independently selected.

Table 20 shows the power supply segments and the I/O pins associated with each segment.

**Table 20. Power Supply Segments**

Power Supply Segment	Pins
VDDIO	CLK_REQ, GPIO_0, GPIO_1, GPIO_2, GPIO_3, GPIO_4, GPIO_5, GPIO_6, GPIO_7, GPIO_8, GPIO_9, GPIO_10, GPIO_11, GPIO_12, GPIO_13, GPIO_14, GPIO_15, GPIO_16, I <sup>2</sup> C0_CLK, I <sup>2</sup> C0_SDATA, I <sup>2</sup> C1_CLK, I <sup>2</sup> C1_SDATA, JTAG_SEL, PWM0, PWM1, PWM2, PWM3, PWM4, PWM5, SFL_CLK, SFL_CS, SFL_IO0, SFL_IO1, SFL_IO2, SFL_IO3, SPI0_CLK, SPI0_CS, SPI0_MISO, SPI0_SISO, SPI1_CLK, SPI1_CS, SPI1_MISO, SPI1_SISO, SRSTN, UART0_CTS, UART0_RTS, UART0_RXD, UART0_TXD, USB2_DSEL
VDDIO_I <sup>2</sup> S	I <sup>2</sup> S_LRCLK0, I <sup>2</sup> S_LRCLK1, I <sup>2</sup> S_MCLK0, I <sup>2</sup> S_MCLK1, I <sup>2</sup> S_SCLK0, I <sup>2</sup> S_SCLK1, I <sup>2</sup> S_SDATAI0, I <sup>2</sup> S_SDATAI1, I <sup>2</sup> S_SDATAO0, I <sup>2</sup> S_SDATAO1
VDDIO_RF	RF_SW_CTRL_0, RF_SW_CTRL_1, RF_SW_CTRL_2, RF_SW_CTRL_3, RF_SW_CTRL_4, RF_SW_CTRL_5, RF_SW_CTRL_6, RF_SW_CTRL_7, RF_SW_CTRL_8, RF_SW_CTRL_9
VDDIO_RMII	RMII_G_COL, RMII_G_CRS, RMII_G_RXC, RMII_G_RXD0, RMII_G_RXD1, RMII_G_RXD2, RMII_G_RXD3, RMII_G_RXDV, RMII_G_TXC, RMII_G_TXD0, RMII_G_TXD1, RMII_G_TXD2, RMII_G_TXD3, RMII_G_TXEN, RMII_MDC, RMII_MDIO

### 13.6 Ethernet MAC Controller (MII/RMII) DC Characteristics

**Table 21. MII Recommended Operating Condition**

Parameter	Symbol	Minimum	Maximum	Units
Supply voltage	GMAC_VDDIO (MII/RMII)	3.14	3.47	V

### 13.7 GPIO, UART, and JTAG Interfaces DC Characteristics

**Table 22. GPIO, UART, and JTAG Interfaces**

Parameter	Symbol	Minimum	Maximum	Units	Conditions
Logic input high voltage	V <sub>IH</sub>	2.0	VDDIO + 0.5	V	–
Logic input low voltage	V <sub>IL</sub>	–0.5	0.8	V	–
Logic output high voltage	V <sub>OH</sub>	2.4	–	V	–
Logic output low voltage	V <sub>OL</sub>	–	0.4	V	–

## 14. WLAN RF Specifications

### 14.1 Introduction

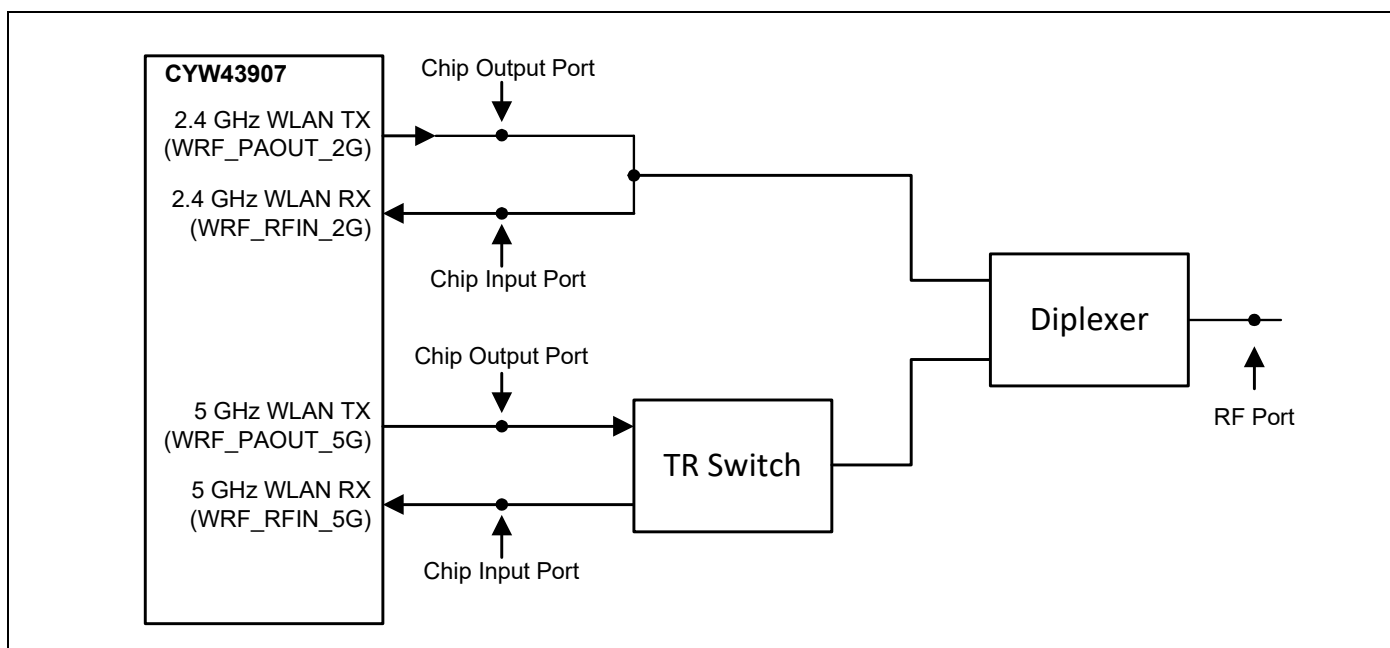

The CYW43907 includes an integrated dual-band direct conversion radio that supports the 2.4 GHz and the 5 GHz bands. This section describes the RF characteristics of the 2.4 GHz and 5 GHz radio.

**Note:** Values in this section of the data sheet are design goals and are subject to change based on device characterization results.

Unless otherwise stated, limit values apply for the conditions specified in [Table 17: “Environmental Ratings”](#) and [Table 19: “Recommended Operating Conditions and DC Characteristics”](#). Typical values apply for the following conditions:

- VBAT = 3.6V
- Ambient temperature +25°C

Figure 16. Port Locations for WLAN Testing

### 14.2 2.4 GHz Band General RF Specifications

Table 23. 2.4 GHz Band General RF Specifications

Item	Condition	Minimum	Typical	Maximum	Unit
TX/RX switch time	Including TX ramp down	–	–	5	µs
RX/TX switch time	Including TX ramp up	–	–	2	µs
Power-up and power-down ramp time	DSSS/CCK modulations	–	–	< 2	µs

**14.3 WLAN 2.4 GHz Receiver Performance Specifications**

**Note:** The specifications shown in Table 24 apply at the chip ports, unless otherwise defined.

**Table 24. WLAN 2.4 GHz Receiver Performance Specifications**

Parameter	Condition/Notes	Minimum	Typical	Maximum	Unit
Frequency range	–	2400	–	2500	MHz
RX sensitivity IEEE 802.11b (8% PER for 1024 octet PSDU)	1 Mbps DSSS	–	–98.9	–	dBm
	2 Mbps DSSS	–	–96.0	–	dBm
	5.5 Mbps DSSS	–	–93.9	–	dBm
	11 Mbps DSSS	–	–90.4	–	dBm
RX sensitivity IEEE 802.11g (10% PER for 1024 octet PSDU)	6 Mbps OFDM	–	–95.0	–	dBm
	9 Mbps OFDM	–	–93.8	–	dBm
	12 Mbps OFDM	–	–92.7	–	dBm
	18 Mbps OFDM	–	–90.3	–	dBm
	24 Mbps OFDM	–	–87.1	–	dBm
	36 Mbps OFDM	–	–83.6	–	dBm
	48 Mbps OFDM	–	–79.3	–	dBm
	54 Mbps OFDM	–	–78.0	–	dBm
RX sensitivity IEEE 802.11n (10% PER for 4096 octet PSDU) <sup>a</sup> Defined for default parameters: 800 ns GI and non-STBC.	20 MHz channel spacing for all MCS rates				
	MCS0	–	–94.6	–	dBm
	MCS1	–	–92.1	–	dBm
	MCS2	–	–89.8	–	dBm
	MCS3	–	–86.6	–	dBm
	MCS4	–	–83.0	–	dBm
	MCS5	–	–78.3	–	dBm
	MCS6	–	–76.6	–	dBm
	MCS7	–	–75.0	–	dBm
Input in-band IP3	Maximum LNA gain	–	–8	–	dBm
	Minimum LNA gain	–	+9	–	dBm
Maximum receive level @ 2.4 GHz	@ 1, 2 Mbps (8% PER, 1024 octets)	–3.5	–	–	dBm
	@ 5.5, 11 Mbps (8% PER, 1024 octets)	–9.5	–	–	dBm
	@ 6, 9, 12 Mbps (10% PER, 1024 octets)	–9.5	–	–	dBm
	@ MCS0–2 rates (10% PER, 4095 octets)	–9.5	–	–	dBm
	@ 18, 24, 36, 48, 54 Mbps (10% PER, 1024 octets)	–14.5	–	–	dBm
	@ MCS3–7 rates (10% PER, 4095 octets)	–14.5	–	–	dBm
Adjacent channel rejection-DSSS (Difference between interfering and desired signal at 8% PER for 1024 octet PSDU with desired signal level as specified in Condition/Notes.)	<b>Desired and interfering signal 30 MHz apart</b>				
	1 Mbps DSSS	–74 dBm	35	–	dB
	2 Mbps DSSS	–74 dBm	35	–	dB
	<b>Desired and interfering signal 25 MHz apart</b>				
	5.5 Mbps DSSS	–70 dBm	35	–	dB
	11 Mbps DSSS	–70 dBm	35	–	dB

**Table 24. WLAN 2.4 GHz Receiver Performance Specifications (Cont.)**

Parameter	Condition/Notes		Minimum	Typical	Maximum	Unit
Adjacent channel rejection-OFDM (Difference between interfering and desired signal (25 MHz apart) at 10% PER for 1024 octet PSDU with desired signal level as specified in Condition/Notes.)	6 Mbps OFDM	-79 dBm	16	-	-	dB
	9 Mbps OFDM	-78 dBm	15	-	-	dB
	12 Mbps OFDM	-76 dBm	13	-	-	dB
	18 Mbps OFDM	-74 dBm	11	-	-	dB
	24 Mbps OFDM	-71 dBm	8	-	-	dB
	36 Mbps OFDM	-67 dBm	4	-	-	dB
	48 Mbps OFDM	-63 dBm	0	-	-	dB
	54 Mbps OFDM	-62 dBm	-1	-	-	dB
Adjacent channel rejection MCS0-7 (Difference between interfering and desired signal (25 MHz apart) at 10% PER for 4096 octet PSDU with desired signal level as specified in Condition/Notes.)	MCS0	-79 dBm	16	-	-	dB
	MCS1	-76 dBm	13	-	-	dB
	MCS2	-74 dBm	11	-	-	dB
	MCS3	-71 dBm	8	-	-	dB
	MCS4	-67 dBm	4	-	-	dB
	MCS5	-63 dBm	0	-	-	dB
	MCS6	-62 dBm	-1	-	-	dB
	MCS7	-61 dBm	-2	-	-	dB
Maximum receiver gain	-	-	-	66	-	dB
Gain control step	-	-	-	3	-	dB
RSSI accuracy <sup>b</sup>	Range -95 <sup>c</sup> dBm to -30 dBm		-5	-	5	dB
	Range above -30 dBm		-8	-	8	dB
Return loss	Z <sub>0</sub> = 50Ω, across the dynamic range		10	11.5	13	dB
Receiver cascaded noise figure	At maximum gain		-	4	-	dB

a. Sensitivity degradations for alternate settings in MCS modes. MM: 0.5 dB drop, and SGI: 2 dB drop.

b. The minimum and maximum values shown have a 95% confidence level.

c. -95 dBm with calibration at time of manufacture, -92 dBm without calibration.

**14.4 WLAN 2.4 GHz Transmitter Performance Specifications**

**Note:** Unless otherwise noted, the values shown in Table 25 apply at the chip ports.

**Table 25. WLAN 2.4 GHz Transmitter Performance Specifications**

Parameter	Condition/Notes	Minimum	Typical	Maximum	Unit	
Frequency range	–	2400	–	2500	MHz	
RF port TX power EVM <sup>a</sup> (highest power setting, 25°C, and VBAT = 3.6)	DSS/CCK	–9 dB	–	20.5	–	dBm
	OFDM, BPSK	–8 dB	–	20	–	dBm
	OFDM, QPSK	–13 dB	–	20	–	dBm
	OFDM, 16-QAM	–19 dB	–	19	–	dBm
	OFDM, 64-QAM (R = 3/4)	–25 dB	–	19	–	dBm
	OFDM, 64-QAM (MCS7, HT20)	–27 dB	–	18.5	–	dBm
OFDM EVM <sup>b</sup> (25°C, VBAT = 3.6V)	OFDM, BPSK	5 dBm	–29	–31	–	dB
	OFDM, 64-QAM	5 dBm	–31	–33	–	dB
	MCS7	5 dBm	–33	–35	–	dB
Phase noise	37.4 MHz crystal, integrated from 10 kHz to 10 MHz	–	0.45	–	Degrees	
TX power control dynamic range	–	10	–	–	dB	
Closed-loop TX power variation at highest power level setting	Across full temperature and voltage range. Applies to 10 dBm to 20 dBm output power range.	–	–	±1.5	dB	
Carrier suppression	–	15	–	–	dBc	
Gain control step	–	–	0.25	–	dB	
Return loss at Chip port TX	Z <sub>o</sub> = 50Ω	–	6	–	dB	

a. This specification row indicates the linear power specification as measured from the chip output port. The requirement is in dBm (TX power). The ratio (dB) in the Conditions/Notes column is the EVM.

b. This specification row indicates the EVM floor. The requirement is in dB (EVM). The power in the Conditions/Notes column is the TX power specification in dBm.

**14.5 WLAN 5 GHz Receiver Performance Specifications**

**Note:** Unless otherwise noted, the values shown in [Table 26](#) apply at the chip ports.

**Table 26. WLAN 5 GHz Receiver Performance Specifications**

Parameter	Condition/Notes	Minimum	Typical	Maximum	Unit
Frequency range	–	4900	–	5845	MHz
RX sensitivity <sup>a</sup> IEEE 802.11a (10% PER for 1000 octet PSDU)	6 Mbps OFDM	–	–93.6	–	dBm
	9 Mbps OFDM	–	–92.4	–	dBm
	12 Mbps OFDM	–	–91.3	–	dBm
	18 Mbps OFDM	–	–88.9	–	dBm
	24 Mbps OFDM	–	–85.7	–	dBm
	36 Mbps OFDM	–	–82.3	–	dBm
	48 Mbps OFDM	–	–77.9	–	dBm
	54 Mbps OFDM	–	–76.6	–	dBm
RX sensitivity <sup>a</sup> IEEE 802.11n (10% PER for 4096 octet PSDU) Defined for default parameters: 800 ns GI and non-STBC.	20 MHz channel spacing for all MCS rates				
	MCS0	–	–93.2	–	dBm
	MCS1	–	–90.7	–	dBm
	MCS2	–	–88.4	–	dBm
	MCS3	–	–85.2	–	dBm
	MCS4	–	–81.6	–	dBm
	MCS5	–	–76.9	–	dBm
	MCS6	–	–75.2	–	dBm
RX sensitivity <sup>a</sup> IEEE 802.11n (10% PER for 4096 octet PSDU) Defined for default parameters: 800 ns GI and non-STBC.	40 MHz channel spacing for all MCS rates				
	MCS0	–	–90.3	–	dBm
	MCS1	–	–87.5	–	dBm
	MCS2	–	–84.9	–	dBm
	MCS3	–	–81.8	–	dBm
	MCS4	–	–78.3	–	dBm
	MCS5	–	–73.9	–	dBm
	MCS6	–	–72.7	–	dBm
Input in-band IP3	Maximum LNA gain	–	–12	–	dBm
	Minimum LNA gain	–	+4	–	dBm
Maximum receive level @ 5 GHz	@ 6, 9, 12 Mbps (10% PER, 1024 octets)	–9.5	–	–	dBm
	@ MCS0–2 rates (10% PER, 4095 octets)	–9.5	–	–	dBm
	@ 18, 24, 36, 48, 54 Mbps (10% PER, 1024 octets)	–14.5	–	–	dBm
	@ MCS3–7 rates (10% PER, 4095 octets)	–14.5	–	–	dBm

**Table 26. WLAN 5 GHz Receiver Performance Specifications (Cont.)**

Parameter	Condition/Notes	Minimum	Typical	Maximum	Unit	
Adjacent channel rejection (Difference between interfering and desired signal (20 MHz apart) at 10% PER for 1000 octet PSDU with desired signal level as specified in Condition/Notes)	6 Mbps OFDM	-79 dBm	16	-	-	dB
	9 Mbps OFDM	-78 dBm	15	-	-	dB
	12 Mbps OFDM	-76 dBm	13	-	-	dB
	18 Mbps OFDM	-74 dBm	11	-	-	dB
	24 Mbps OFDM	-71 dBm	8	-	-	dB
	36 Mbps OFDM	-67 dBm	4	-	-	dB
	48 Mbps OFDM	-63 dBm	0	-	-	dB
	54 Mbps OFDM	-62 dBm	-1	-	-	dB
Alternate adjacent channel rejection (Difference between interfering and desired signal (40 MHz apart) at 10% PER for 1000 <sup>b</sup> octet PSDU with desired signal level as specified in Condition/Notes)	6 Mbps OFDM	-78.5 dBm	32	-	-	dB
	9 Mbps OFDM	-77.5 dBm	31	-	-	dB
	12 Mbps OFDM	-75.5 dBm	29	-	-	dB
	18 Mbps OFDM	-73.5 dBm	27	-	-	dB
	24 Mbps OFDM	-70.5 dBm	24	-	-	dB
	36 Mbps OFDM	-66.5 dBm	20	-	-	dB
	48 Mbps OFDM	-62.5 dBm	16	-	-	dB
	54 Mbps OFDM	-61.5 dBm	15	-	-	dB
65 Mbps OFDM	-60.5 dBm	14	-	-	dB	
Maximum receiver gain	-	-	66	-	dB	
Gain control step	-	-	3	-	dB	
RSSI accuracy <sup>c</sup>	Range -92 dBm to -30 dBm	-5	-	5	dB	
	Range above -30 dBm	-8	-	8	dB	
Return loss	Z <sub>o</sub> = 50Ω, across the dynamic range	10	-	13	dB	
Receiver cascaded noise figure	At maximum gain	-	5	-	dB	

- a. For PCIE derate the 5 GHz RX sensitivity by 1.5 dB
- b. For 65 Mbps, the size is 4096.
- c. The minimum and maximum values shown have a 95% confidence level.

### 14.6 WLAN 5 GHz Transmitter Performance Specifications

Note: Unless otherwise noted, the values shown in Table 27 apply at the chip ports.

**Table 27. WLAN 5 GHz Transmitter Performance Specifications**

Parameter	Condition/Notes	Minimum	Typical	Maximum	Unit
Frequency range	–	4900	–	5845	MHz
RF port TX power EVM <sup>a</sup> (highest power setting, 25°C, and VBAT = 3.6)	OFDM, QPSK	–13 dB	20	–	dBm
	OFDM, 16-QAM	–19 dB	18.5	–	dBm
	OFDM, 64-QAM (R = 3/4)	–25 dB	17	–	dBm
	OFDM, 64-QAM (MCS7, HT20)	–27 dB	16.5	–	dBm
OFDM EVM <sup>b</sup> (25°C, VBAT = 3.6V)	OFDM, BPSK	0 dBm	–30	–	dB
	OFDM, 64-QAM	0 dBm	–33	–	dB
	MCS7	0 dBm	–34	–	dB
Phase noise	37.4 MHz Crystal, Integrated from 10 kHz to 10 MHz	–	0.5	–	Degrees
TX power control dynamic range	–	10	–	–	dB
Closed loop TX power variation at highest power level setting	Across full-temperature and voltage range. Applies across 10 to 20 dBm output power range.	–	–	±2.0	dB
Carrier suppression	–	15	–	–	dBc
Gain control step	–	–	0.25	–	dB
Return loss	Z <sub>o</sub> = 50Ω	–	6	–	dB

- a. This specification row indicates the linear power specification as measured from the chip output port. The requirement is in dBm (TX power). The ratio (dB) in the Conditions/Notes column is the EVM.
- b. This specification row indicates the EVM floor. The requirement is in dB (EVM). The power in the Conditions/Notes column is the TX power specification in dBm.

### 14.7 General Spurious Emissions Specifications

This section provides the TX and RX spurious emissions specifications for the WLAN 2.4 GHz and 5 GHz bands. The recommended spectrum analyzer settings for the spurious emissions specifications are provided in Table 28.

**Table 28. Recommended Spectrum Analyzer Settings**

Parameter	Setting
Resolution bandwidth (RBW)	1 MHz
Video bandwidth (VBW)	1 MHz
Sweep	Auto
Span	100 MHz
Detector	Maximum peak
Trace	Maximum hold
Modulation	OFDM

14.7.1 Transmitter Spurious Emissions Specifications

**2.4 GHz Band Spurious Emissions**

*20-MHz Channel Spacing*

**Table 29. 2.4 GHz Band, 20-MHz Channel Spacing TX Spurious Emissions Specifications**

2G - 20 MHz BW		Spurious Emissions Level (dBm)	
Emissions Frequency Range (MHz)	Channel Power (dBm)	CH2442	
1000-2000	21	-50	
2000-2400	21	-40	
2500-3000	21	-40	
3000-4000	21	-39	
4000-5000	21	-24	
5000-6000	21	-48	
6000-7000	21	-49	
7000-8000	21	-13	
8000-10000	21	-43	
10000-12000	21	-52	
12000-15000	21	-50

	3.45 GHz < f < 3.9 GHz	-48.6	-47.6	dBm

## 15. Internal Regulator Electrical Specifications

### 15.1 Core Buck Switching Regulator

**Note:** Values in this data sheet are design goals and are subject to change based on device characterization results.

**Note:** Functional operation is not guaranteed outside of the specification limits provided in this section.

**Table 33. Core Buck Switching Regulator (CLOCK) Specifications**

Specification	Notes	Min.	Typ.	Max.	Unit
Input supply voltage (DC)	DC voltage range inclusive of disturbances.	3.0	3.6	4.8 <sup>a</sup>	V
PWM mode switching frequency	CCM, load > 100 mA VBAT = 3.6V.	–	4	–	MHz
PWM output current	–	–	–	550	mA
Output current limit	–	–	1400	–	mA
Output voltage range	Programmable, 30 mV steps. Default = 1.35V.	1.2	1.35	1.5	V
PWM output voltage DC accuracy	Includes load and line regulation. Forced PWM mode.	–4	–	4	%
PWM ripple voltage, static	Measure with 20 MHz bandwidth limit. Static load. Max. ripple based on VBAT = 3.6V, Vout = 1.35V, Fsw = 4 MHz, 2.2 μH inductor with min. effective L > 1.05 μH, cap. + board total – ESR < 20 mΩ, C <sub>out</sub> > 1.9 μF, ESL < 200 pH	–	7	20	mVpp
PWM mode peak efficiency	Peak efficiency at 200 mA load.	78	86	–	%
PFM mode efficiency	10 mA load current.	70	81	–	%
Start-up time from power down	VIO already ON and steady. Time from REG_ON rising edge to CLDO reaching 1.2V.	–	400	500	μs
External inductor	0806 size, 2.2 μH, DCR = 0.11Ω, ACR = 1.18Ω @ 4 MHz.	–	2.2	–	μH
External output capacitor	Ceramic, X5R, 0402, ESR < 30 mΩ at 4 MHz, 4.7 μF ±20%, 6.3V.	2.0 <sup>b</sup>	4.7	10 <sup>c</sup>	μF
External input capacitor	For SR_VDDBAT5V pin, ceramic, X5R, 0603, ESR < 30 mΩ at 4 MHz, ±4.7 μF ±20%, 6.3V.	0.67 <sup>b</sup>	4.7	–	μF
Input supply voltage ramp-up time	0 to 4.3V.	40	–	–	μs

a. The maximum continuous voltage is 4.8V. Voltages up to 6.0V for up to 10 seconds, cumulative duration, over the lifetime of the device are allowed. Voltages as high as 5.0V for up to 250 seconds, cumulative duration, over the lifetime of the device are allowed.

b. Minimum capacitor value refers to the residual capacitor value after taking into account the part-to-part tolerance, DC-bias, temperature, and aging.

c. Total capacitance includes those connected at the far end of the active load.

**15.2 3.3V LDO (LDO3P3)**
**Table 34. LDO3P3 Specifications**

Specification	Notes	Min.	Typ.	Max.	Units
Input supply voltage, $V_{in}$	Min. = $V_o + 0.2V = 3.5V$ dropout voltage requirement must be met under maximum load for performance specifications.	3.0	3.6	4.8 <sup>a</sup>	V
Output current	–	0.001	–	450	mA
Nominal output voltage, $V_o$	Default = 3.3V.	–	3.3	–	V
Dropout voltage	At max. load.	–	–	200	mV
Output voltage DC accuracy	Includes line/load regulation.	–5	–	+5	%
Quiescent current	No load.	–	–	85	$\mu A$
Line regulation	$V_{in}$ from ( $V_o + 0.2V$ ) to 4.8V, max. load.	–	–	3.5	mV/V
Load regulation	Load from 1 mA to 450 mA.	–	–	0.3	mV/mA
PSRR	$V_{in} \geq V_o + 0.2V$ , $V_o = 3.3V$ , $C_o = 4.7 \mu F$ , Max load, 100 Hz to 100 kHz.	20	–	–	dB
LDO turn-on time	Chip already powered up.	–	160	250	$\mu s$
External output capacitor, $C_o$	Ceramic, X5R, 0402, (ESR: 5 m $\Omega$ –240 m $\Omega$ ), $\pm 10\%$ , 10V.	1.0 <sup>b</sup>	4.7	10	$\mu F$
External input capacitor	For LDO_VDDBAT5V pin (shared with band gap) ceramic, X5R, 0402, (ESR: 30m $\Omega$ –200 m $\Omega$ ), $\pm 10\%$ , 10V. Not needed if sharing 4.7 $\mu F$ VBAT capacitor with SR_VDDBAT5V.	–	4.7	–	$\mu F$

a. The maximum continuous voltage is 4.8V. Voltages up to 6.0V for up to 10 seconds, cumulative duration, over the lifetime of the device are allowed. Voltages as high as 5.0V for up to 250 seconds, cumulative duration, over the lifetime of the device are allowed.

b. Minimum capacitor value refers to the residual capacitor value after taking into account the part-to-part tolerance, DC-bias, temperature, and aging.

**15.3 CLDO**

**Table 35. CLDO Specifications**

Specification	Notes	Min.	Typ.	Max.	Units
Input supply voltage, $V_{in}$	Min. = $1.2 + 0.15V = 1.35V$ dropout voltage requirement must be met under maximum load.	1.3	1.35	1.5	V
Output current	–	0.2	–	350	mA
Output voltage, $V_o$	Programmable in 10 mV steps. Default = 1.2V.	0.95	1.2	1.26	V
Dropout voltage	At max. load.	–	–	150	mV
Output voltage DC accuracy	Includes line/load regulation.	–4	–	+4	%
Quiescent current	No load.	–	26	–	$\mu A$
	200 mA load.	–	2.48	–	mA
Line regulation	$V_{in}$ from ( $V_o + 0.15V$ ) to 1.5V, maximum load.	–	–	5	mV/V
Load regulation	Load from 1 mA to 300 mA.	–	0.02	0.05	mV/mA
Leakage current	Power down.	–	10	40	$\mu A$
	Bypass mode.	–	2	6	$\mu A$
PSRR	@1 kHz, $V_{in} \geq 1.35V$ , $C_o = 4.7 \mu F$ .	20	–	–	dB
Start-up time of PMU	VIO up and steady. Time from the REG_ON rising edge to the CLDO reaching 1.2V.	–	–	700	$\mu s$
LDO turn-on time	LDO turn-on time when the rest of the chip is up.	–	140	180	$\mu s$
External output capacitor, $C_o$	Total ESR: 5 m $\Omega$ –240 m $\Omega$ .	3.76 <sup>a</sup>	4.7	–	$\mu F$
External input capacitor	Only use an external input capacitor at the LDO_VDD1P5 pin if it is not supplied from the CBUCK output.	–	1	2.2	$\mu F$

a. Minimum capacitor value refers to the residual capacitor value after taking into account the part-to-part tolerance, DC-bias, temperature, and aging.

**15.4 LNLDO**
**Table 36. LNLDO Specifications**

Specification	Notes	Min.	Typ.	Max.	Units
Input supply voltage, $V_{in}$	Min. $V_{IN} = V_O + 0.15V = 1.35V$ (where $V_O = 1.2V$ ) dropout voltage requirement must be met under maximum load.	1.3	1.35	1.5	V
Output current	–	0.1	–	150	mA
Output voltage, $V_O$	Programmable in 25 mV steps. Default = 1.2V.	1.1	1.2	1.275	V
Dropout voltage	At maximum load.	–	–	150	mV
Output voltage DC accuracy	Includes line/load regulation.	–4	–	+4	%
Quiescent current	No load.	–	44	–	$\mu A$
	Max. load.	–	970	990	$\mu A$
Line regulation	$V_{in}$ from ( $V_O + 0.1V$ ) to 1.5V, 150 mA load.	–	–	5	mV/V
Load regulation	Load from 1 mA to 150 mA.	–	0.02	0.05	mV/mA
Leakage current	Power-down.	–	–	10	$\mu A$
Output noise	@30 kHz, 60–150 mA load $C_O = 2.2 \mu F$ . @100 kHz, 60–150 mA load $C_O = 2.2 \mu F$ .	–	–	60 35	nV/rt Hz nV/rt Hz
PSRR	@ 1kHz, Input > 1.35V, $C_O = 2.2 \mu F$ , $V_O = 1.2V$ .	20	–	–	dB
LDO turn-on time	LDO turn-on time when the rest of the chip is up.	–	140	180	$\mu s$
External output capacitor, $C_O$	Total ESR (trace/capacitor): 5 m $\Omega$ –240 m $\Omega$ .	0.5 <sup>a</sup>	2.2	4.7	$\mu F$
External input capacitor	Only use an external input capacitor at the LDO_VDD1P5 pin if it is not supplied from the CBUCK output. Total ESR (trace/capacitor): 30 m $\Omega$ –200 m $\Omega$ .	–	1	2.2	$\mu F$

a. Minimum capacitor value refers to the residual capacitor value after taking into account the part-to-part tolerance, DC-bias, temperature, and aging.

**15.5 BBPLL LDO**
**Table 37. BBPLL LDO Specifications**

Parameter	Conditions and Comments	Min.	Typ.	Max.	Units
Input supply voltage, $V_{in}$	Min. $V_{in} = V_o + 0.15V = 1.35V$ (for $V_o = 1.2V$ ). The dropout voltage requirement must be met under maximum load.	1.3	1.35	1.5	V
Output voltage, $V_o$	Programmable in 25 mV steps. Default = 1.2V.	1.1	1.2	1.275	V
Dropout voltage	At max. load	–	–	150	mV
Output voltage DC accuracy	Includes line/load regulation.	–4	–	+4	%
Output current	Peak load = 80 mA, average = 35 mA	0.1	–	55	mA
Quiescent current	No load	–	10	12	$\mu A$
	55 mA load	–	550	570	$\mu A$
Line regulation	$V_{in}$ from ( $V_o + 0.15V$ ) to 1.5V; 200 mA load	–	–	5	mV/V
Load regulation	load from 1mA to 200 mA; $V_{in} \geq (V_o + 0.15V)$	–	0.025	0.045	mV/mA
Leakage current	Powered down. Junction temperature is 85°C.	–	5	20	$\mu A$
	Bypass mode	–	0.2	1.5	$\mu A$
PSRR	@1 kHz, $V_{in} \geq V_o + 0.15V$ , $C_o = 4.7 \mu F$	20	–	–	dB
Start-up time of PMU	VIO up and steady. Time from REG_ON rising edge to CLDO reaching 99% of $V_o$ .	–	530	700	us
LDO turn-on time	The LDO turn-on time when the rest of the chip is up.	–	140	180	us
Inrush current	$V_{in} = V_o + 0.15V$ to 1.5V, $C_o = 0.47 \mu F$ , no load	–	60	70	mA
External output capacitor, $C_o$	Ceramic, X5R, size 0201, max. 6.3V, 20% tolerance	0.27	0.47	–	$\mu F$
External input capacitor	Only use an external input capacitor at the LDO_VDD1P5 pin if it is not supplied from the CBUCK output.	–	1	–	$\mu F$

## 16. System Power Consumption

**Note:** Values in this data sheet are design goals and are subject to change based on the results of device characterization.

**Note:** Unless otherwise stated, these values apply for the conditions specified in Table 19: “Recommended Operating Conditions and DC Characteristics”.

### 16.1 WLAN Current Consumption

The tables in this subsection show the typical, total current used by the CYW43907. Current values may be measured with the APPS core powered off. The first column of the table, the mode description, will state the power condition of the APPS core.

#### 16.1.1 2.4 GHz Mode

**Table 38. 2.4 GHz Mode WLAN Current Consumption**

Mode	V <sub>BAT</sub> = 3.6V <sup>a</sup> (μA)	VDDIO = VDDIO_HIB = 3.3V <sup>a, b, c</sup> (μA)
<b>Sleep Modes</b>		
Radio off <sup>d</sup>	3	3
Sleep <sup>e, f</sup>	6	160
IEEE Power Save, DTIM=1, single RX, APPS powered down <sup>g</sup>	2180	160
IEEE Power Save, DTIM=3, single RX, APPS powered down <sup>h</sup>	680	160
IEEE Power Save, DTIM=9, single RX, APPS powered down	233	160
<b>Active Modes</b>		
Continuous RX mode MCS7, HT20, 1SS, APPS powered up <sup>i, j</sup>	57,200	60
CRS-HT20, APPS powered up <sup>k</sup>	55,200	60
Continuous TX mode 1 Mbps, APPS powered up <sup>l</sup>	325,000	60
Continuous TX mode MCS7, HT20, 1SS, 1 TX, APPS powered up <sup>m</sup>	302,900	60
<b>Ping Modes</b>		
Ping to associated access point <sup>l</sup>	336,000	60
Sleep	6	160

a. Typical silicon.

b. VIO is specified with all pins idle (not switching) and not driving any loads.

c. Excludes VDDIO\_USB, VDDIO\_RMII, VDDIO\_I2S, and VDDIO\_SD.

d. REG\_ON is low or the device is in hibernation, and all supplies are present.

e. REG\_ON is high. APPS domain is powered down. WLAN domain is in low-power state retention mode. Top level is powered up.

f. Inter-beacon current.

g. Beacon Interval = 102.4 ms. Beacon duration = 1 ms @ 1 Mbps. Average current over 3× DTIM intervals.

h. Beacon interval = 307.2 ms. Beacon duration = 1 ms @ 1 Mbps. Average current over 3× DTIM intervals.

i. Duty cycle is 100%. Carrier sense (CS) detect/packet receive.

j. Measured using packet engine test mode.

k. Carrier sense (CCA) when no carrier present.

l. Duty cycle is 100%. TX power at chip output ~17.7 dBm.

m. Duty cycle is 100%. TX power at chip output ~15.2 dBm.

## 16.1.2 5 GHz Mode

**Table 39. 5 GHz Mode WLAN Current Consumption**

Mode	V <sub>BAT</sub> = 3.6V <sup>a</sup> ( $\mu$ A)	VDDIO = VDDIO_HIB = 3.3V <sup>a, b, c</sup> ( $\mu$ A)
<b>Sleep Modes</b>		
Radio off <sup>d</sup>	3	3
Sleep <sup>e, f</sup>	6	160
IEEE Power Save, DTIM=1, single RX, APPS powered down <sup>g</sup>	1390	160
IEEE Power Save, DTIM=3, single RX, APPS powered down <sup>h</sup>	470	160
IEEE Power Save, DTIM=9, single RX, APPS powered down	160	160
<b>Active Modes</b>		
Continuous RX mode MCS7, HT20, 1SS, APPS powered up <sup>i, j</sup>	72,400	60
Continuous RX mode MCS7, HT40, 1SS, APPS powered up <sup>i, j</sup>	84,700	60
CRS-HT20, APPS powered up <sup>k</sup>	70,200	60
CRS-HT40, APPS powered up <sup>k</sup>	79,500	60
Continuous TX mode MCS7, HT20, 1SS, 1 TX, APPS powered up <sup>l</sup>	312,000	60
Continuous TX mode MCS7, HT40, 1SS, 1 TX, APPS powered up <sup>m</sup>	309,000	60
<b>Ping Modes</b>		
Ping to associated access point <sup>l</sup>	327,000	60
Sleep	6	160

a. Typical silicon.

b. VIO is specified with all pins idle (not switching) and not driving any loads.

c. Excludes VDDIO\_USB, VDDIO\_RMII, VDDIO\_I2S, and VDDIO\_SD.

d. REG\_ON is low or the device is in hibernation, and all supplies are present.

e. REG\_ON is high. APPS domain is powered down. WLAN domain is in low-power state retention mode. Top level is powered up.

f. Inter-beacon current.

g. Beacon Interval = 102.4 ms. Beacon duration = 1 ms @ 1 Mbps. Average current over 3× DTIM intervals.

h. Beacon interval = 307.2 ms. Beacon duration = 1 ms @ 1 Mbps. Average current over 3× DTIM intervals.

i. Duty cycle is 100%. Carrier sense (CS) detect/packet receive.

j. Measured using packet engine test mode.

k. Carrier sense (CCA) when no carrier present.

l. Duty cycle is 100%. TX power at chip output ~13.9 dBm.

m. Duty cycle is 100%. TX power at chip output ~12.9 dBm.

## 17. Interface Timing and AC Characteristics

### 17.1 Ethernet MAC (MII/RMII) Interface Timing

#### 17.1.1 MII Receive Packet Timing

Figure 17 and Table 40 provide the MII receive packet timing.

Figure 17. MII Receive Packet Timing

Table 40. MII Receive Packet Timing Parameters

Parameter	Description	Minimum	Typical	Maximum	Units
t401	RXDV and RXD[3:0] to RXC rising setup time	10	–	–	ns
t402	RXC clock period (10BASE-T mode)	–	400	–	ns
	RXC clock period (100BASE-TX mode)	–	40	–	ns
t403	RXC low/high time (10BASE-T mode)	160	–	240	ns
	RXC low/high time (100BASE-TX mode)	16	–	24	ns
t404	RXDV and RXD[3:0] to RXC rising hold time	10	–	–	ns
–	Duty cycle	40	50	60	%

#### 17.1.2 MII Transmit Packet Timing

Figure 18 and Table 41 provide the MII transmit packet timing.

Figure 18. MII Transmit Packet Timing

Table 41. MII Transmit Packet Timing Parameters

Parameter	Description	Minimum	Typical	Maximum	Units
t405	TXC high to TXEN and TXD[3:0] valid	0	–	25	ns
t406	TXC high to TXEN and TXD[3:0] invalid (hold)	0	–	–	ns

17.1.3 RMI Receive Packet Timing

Figure 19 and Table 42 provide the RMI receive packet timing.

**Figure 19. RMI Receive Packet Timing**

**Table 42. RMI Receive Packet Timing**

Parameter	Symbol	Minimum	Typical	Maximum	Unit
REF_CLK Cycle Time	–	–	20	–	ns
RXD[1:0], RXER, CRS_DV Output delay from REF_CLK rising	–	2	–	10	ns

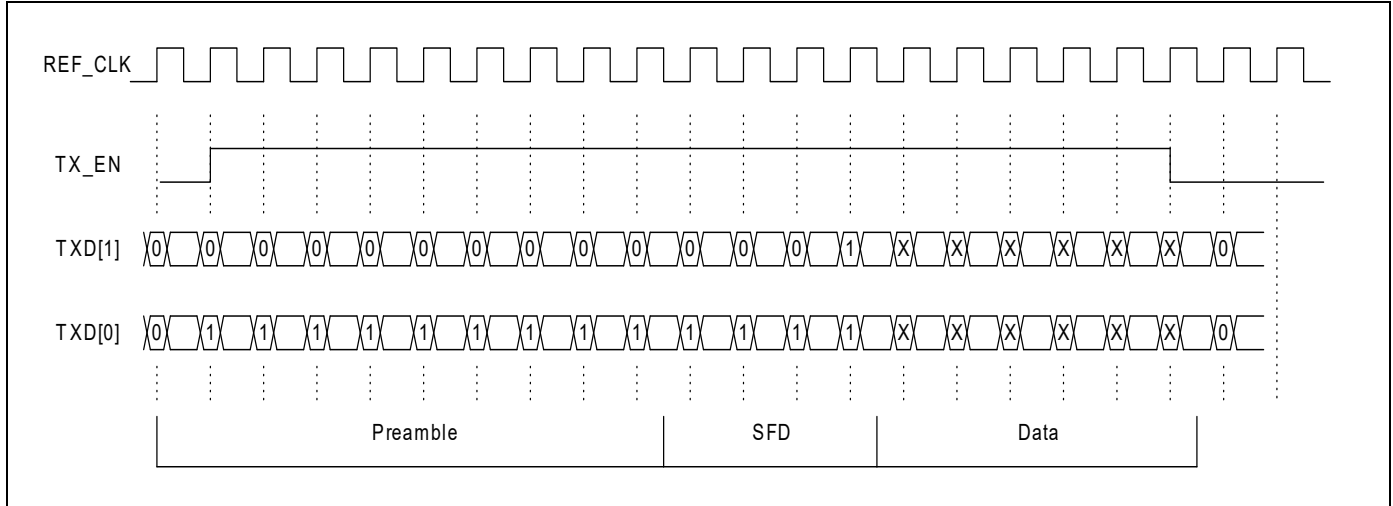

**Notes:**

1. In 10 Mbps mode, there are ten REF\_CLK periods per data period.
2. The receiver accounts for differences between the local REF\_CLK and the recovered clock through use of sufficient elasticity buffering.

17.1.4 RMI Transmit Packet Timing

Figure 20 and Table 43 provide the RMI transmit packet timing.

**Figure 20. RMI Transmit Packet Timing**

**Table 43. RMI Transmit Packet Timing Parameters**

Parameter	Symbol	Minimum	Typical	Maximum	Unit
REF_CLK Cycle Time	–	–	20	–	ns
TXEN, TXER, TXD[1:0] setup time to REF_CLK rising	TXEN_SETUP	4	–	–	ns
TXEN, TXER, TXD[1:0] hold time from REF_CLK rising	TXEN_HOLD	2	–	–	ns

**Notes:**

1. TXD[1:0] provides valid data for each REF\_CLK period while TX\_EN is asserted.
2. In 10 Mbps mode, there are ten REF\_CLK periods per data period.

### 17.2 I<sup>2</sup>S Master and Slave Mode TX Timing

Figure 21 and Table 44 provide the I<sup>2</sup>S Master mode transmitter timing.

Figure 21. I<sup>2</sup>S Master Mode Transmitter Timing

Figure 22 and Table 44 provide the I<sup>2</sup>S Slave mode receiver timing.

Figure 22. I<sup>2</sup>S Slave Mode Receiver Timing

**Table 44. Timing for I<sup>2</sup>S Transmitters and Receivers**

Parameter	Transmitter				Receiver	
	Lower Limit		Upper Limit		Lower Limit	
	Minimum	Maximum	Minimum	Maximum	Minimum	Maximum
Clock period T	$T_{tr}$	–	–	–	$T_{tr}$	–
Slave mode:						
Clock HIGH, $t_{HC}$	–	$0.35T_r$	–	–	–	$0.35T_r$
Clock LOW, $t_{LC}$	–	$0.35T_r$	–	–	–	$0.35T_r$
Clock rise time, $t_{RC}$	–	–	$0.15T_{tr}$	–	–	–
Transmitter delay, $t_{dtr}$	–	–	–	$0.8T$	–	–
Transmitter hold time, $t_{htr}$	0	–	–	–	–	–
Receiver setup time, $t_{sr}$	–	–	–	–	–	$0.2T_r$
Receiver hold time, $t_{hr}$	–	–	–	–	–	0

Table 45 provides the I2S\_MCLK specification.

**Table 45. I2S\_MCLK Specification**

Parameter	Minimum	Typical	Maximum	Unit
Frequency range	1	–	40	MHz
Frequency accuracy (with respect to the XTAL frequency)	–	1	–	ppb
Tuning resolution	–	50	–	ppb
Tuning range	–	1000	–	ppm
Tuning step size	–	–	10	ppm
Tuning rate	–	1	–	ppm/ms
Baseband jitter (100 Hz to 40 kHz)	–	–	100	ps rms
Wideband jitter (100 Hz to 1 MHz)	–	–	200	ps rms

Figure 23 shows the I<sup>2</sup>S frame-level timing.

**Figure 23. I<sup>2</sup>S Frame-Level Timing**

### 17.3 SDIO Interface Timing

#### 17.3.1 SDIO Default-Speed Mode Timing

SDIO default-speed (DS) mode timing is shown by the combination of Figure 24 and Table 46.

Figure 24. SDIO Bus Timing (Default-Speed Mode)

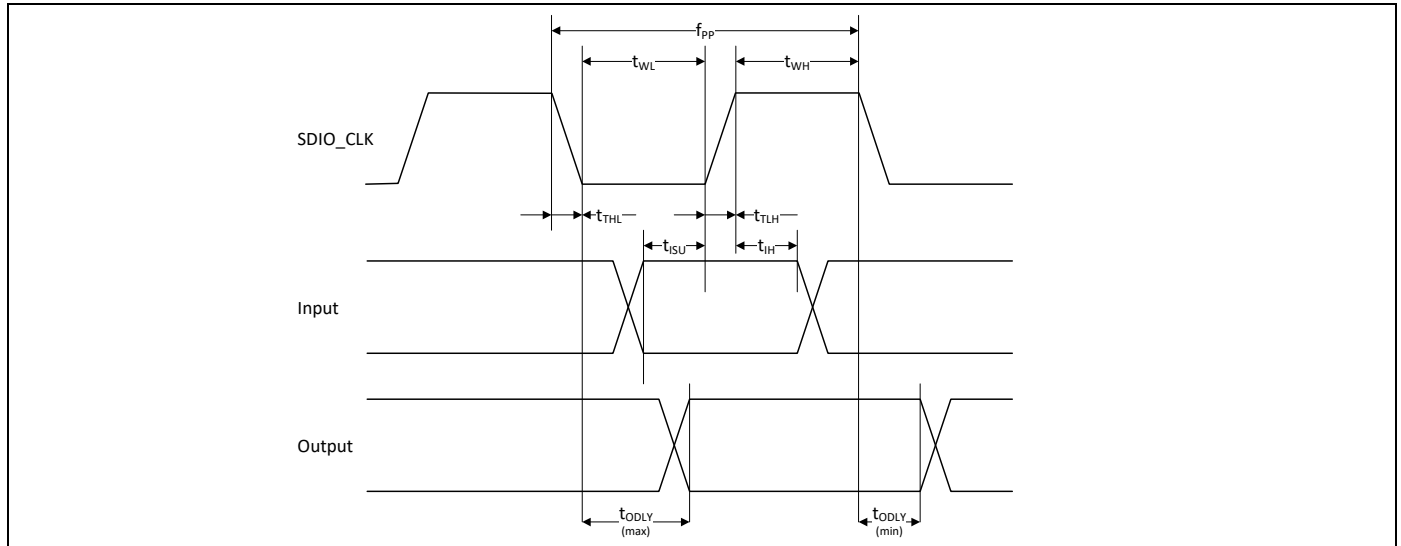

Table 46. SDIO Bus Timing<sup>a</sup> Parameters (Default-Speed Mode)

Parameter	Symbol	Minimum	Typical	Maximum	Unit
<b>SDIO_CLK or CLK—All values are referred to minimum VIH and maximum VIL<sup>b</sup></b>					
Frequency – Data Transfer mode	f <sub>PP</sub>	0	–	25	MHz
Frequency – Identification mode	f <sub>OD</sub>	0	–	400	kHz
Clock low time	t <sub>WL</sub>	10	–	–	ns
Clock high time	t <sub>WH</sub>	10	–	–	ns
Clock rise time	t <sub>TLH</sub>	–	–	10	ns
Clock low time	t <sub>THL</sub>	–	–	10	ns
<b>Inputs: CMD, DAT (referenced to CLK)</b>					
Input setup time	t <sub>ISU</sub>	5	–	–	ns
Input hold time	t <sub>IH</sub>	5	–	–	ns
<b>Outputs: CMD, DAT (referenced to CLK)</b>					
Output delay time – Data Transfer mode	t <sub>ODLY</sub>	0	–	14	ns
Output delay time – Identification mode	t <sub>ODLY</sub>	0	–	50	ns

a. Timing is based on CL ≤ 40 pF load on CMD (command) and DAT (data) lines.

b. Min. (V<sub>ih</sub>) = 0.7 × VDDIO and max. (V<sub>il</sub>) = 0.2 × VDDIO.

17.3.2 SDIO High-Speed Mode Timing

SDIO high-speed (HS) mode timing is shown by the combination of Figure 25 and Table 47.

Figure 25. SDIO Bus Timing (High-Speed Mode)

Table 47. SDIO Bus Timing<sup>a</sup> Parameters (High-Speed Mode)

Parameter	Symbol	Minimum	Typical	Maximum	Unit
<b>SDIO_CLK or CLK—All values are referred to minimum V<sub>IH</sub> and maximum V<sub>IL</sub><sup>b</sup></b>					
Frequency – Data Transfer Mode	f <sub>PP</sub>	0	–	50	MHz
Frequency – Identification Mode	f <sub>OD</sub>	0	–	400	kHz
Clock low time	t <sub>WL</sub>	7	–	–	ns
Clock high time	t <sub>WH</sub>	7	–	–	ns
Clock rise time	t <sub>TLH</sub>	–	–	3	ns
Clock low time	t <sub>THL</sub>	–	–	3	ns
<b>Inputs: CMD, DAT (referenced to CLK)</b>					
Input setup time	t <sub>ISU</sub>	6	–	–	ns
Input hold time	t <sub>IH</sub>	2	–	–	ns
<b>Outputs: CMD, DAT (referenced to CLK)</b>					
Output delay time – Data Transfer Mode	t <sub>ODLY</sub>	–	–	14	ns
Output hold time	t <sub>OH</sub>	2.5	–	–	ns
Total system capacitance (each line)	CL	–	–	40	pF

a. Timing is based on CL ≤ 40 pF load on CMD (command) and DAT (data) lines.

b. Min. (V<sub>IH</sub>) = 0.7 × VDDIO and max. (V<sub>IL</sub>) = 0.2 × VDDIO.

17.3.3 SDIO Bus Timing Specifications in SDR Modes

**Clock Timing**

SDIO clock timing in the SDR modes is shown by the combination of Figure 26 and Table 48.

Figure 26. SDIO Clock Timing (SDR Modes)

Table 48. SDIO Bus Clock Timing Parameters (SDR Modes)

Parameter	Symbol	Minimum	Maximum	Unit	Comments
–	$t_{CLK}$	40	–	ns	SDR12 mode
		20	–	ns	SDR25 mode
–	$t_{CR}, t_{CF}$	–	$0.2 \times t_{CLK}$	ns	$C_{CARD} = 10 \text{ pF}$
Clock duty cycle	–	30	70	%	–

**Device Input Timing**

SDIO device input timing in the SDR modes is shown by the combination of Figure 27 and Table 49.

Figure 27. SDIO Bus Input Timing (SDR Modes)

Table 49. SDIO Bus Input Timing Parameters (SDR Modes)

Symbol	Minimum	Maximum	Unit	Comments
$t_{IS}$	3.00	–	ns	$C_{CARD} = 10 \text{ pF}, V_{CT} = 0.975V$
$t_{IH}$	0.80	–	ns	$C_{CARD} = 5 \text{ pF}, V_{CT} = 0.975V$

**Device Output Timing**

SDIO device output timing in the SDR modes with clock rates up to 50 MHz is shown by the combination of Figure 28 and Table 50.

**Figure 28. SDIO Bus Output Timing (SDR Modes up to 50 MHz)**

**Table 50. SDIO Bus Output Timing Parameters (SDR Modes up to 50 MHz)**

Symbol	Minimum	Maximum	Unit	Comments
$t_{ODLY}$	–	14.0	ns	$t_{CLK} \geq 20$ ns $C_L = 40$ pF
$t_{OH}$	1.5	–	ns	Hold time at the $t_{ODLY}$ (min.) $C_L = 15$ pF

**17.4 S/PDIF Interface Timing**

The S/PDIF protocol embeds the clock and data within a stream of data using a Biphase Mark Code (BMC).

Figure 29 shows the S/PDIF interface timing.

**Figure 29. S/PDIF Interface Timing**

Figure 30 shows the S/PDIF data output timing.

**Figure 30. S/PDIF Data Output Timing**

Table 51 provides the S/PDIF biphas mark code timing parameters (to be used in conjunction with Figure 30).

**Table 51. SPDIF Biphas Mark Code Timing Parameters**

Parameter	Symbol	Minimum	Maximum	Unit	Comments
–	$t_{CLK}$	40	–	ns	192 kHz sample rate
–	$t_{CR}, t_{CF}$	–	$0.3 \times t_{CLK}$	ns	–
Duty cycle	–	30	70	%	–

Table 52 provides the S/PDIF biphas mark code sample rate and receiver clock frequency.

**Table 52. SPDIF Biphas Mark Code Sample Rate and Receiver Clock Frequency**

Parameter	Symbol	Minimum	Maximum	Unit	Comments
Sampling frequency	$f_S$	–	192	kHz	192 kHz sample rate maximum.
Component clock frequency	$f_{CLOCK}$	–	25	MHz	Typical is $128 \times f_S$ , max is $192 \times f_S$ . Clock is $2 \times$ the desired data rate or $2 \times 192 \text{ kHz} \times 64 = 24.576 \text{ MHz}$ .

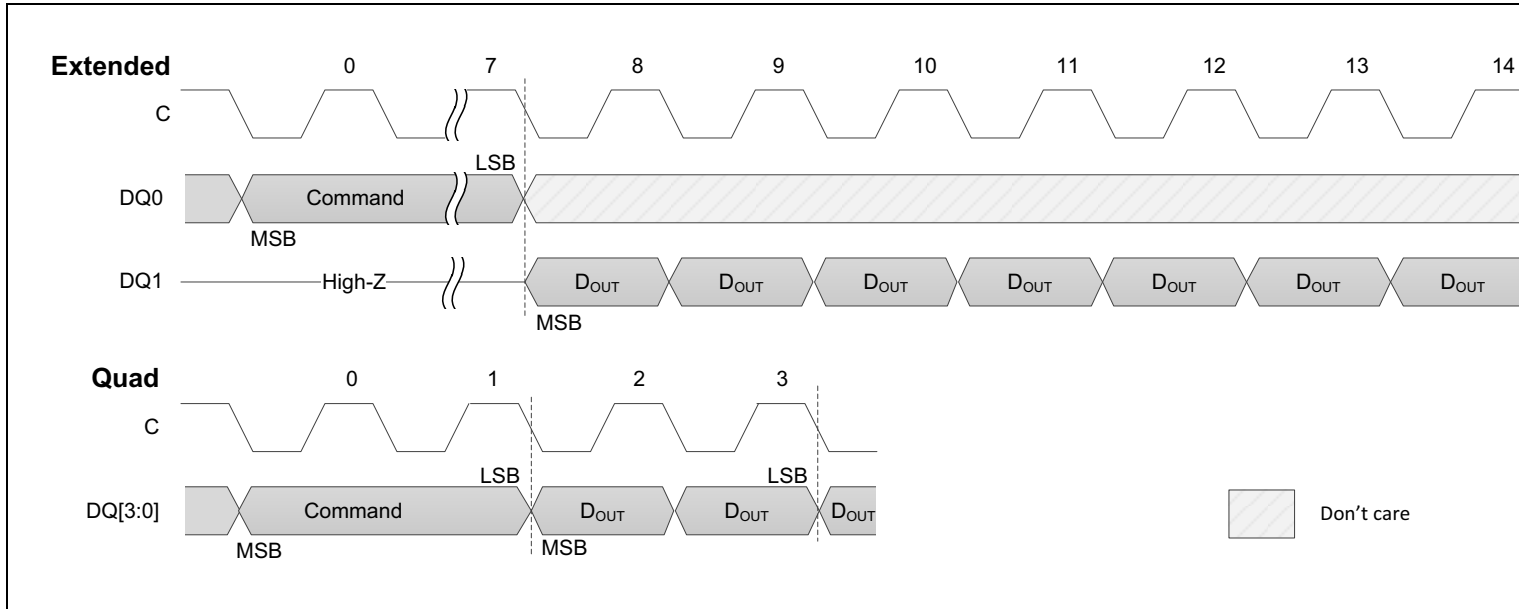

## 17.5 SPI Flash Timing

### 17.5.1 Read-Register Timing

Figure 31 shows the SPI flash extended and quad read-register timing.

**Note:** Regarding Figure 31: All Read Register commands except Read Lock Register are supported. A Read Nonvolatile Configuration Register operation will output data starting from the least significant byte.

Figure 31. SPI Flash Read-Register Timing

17.5.2 Write-Register Timing

Figure 32 shows the SPI flash extended and quad write-register timing.

**Note:** Regarding Figure 32:

1. All write-register commands except Write Lock Register are supported.
2. The waveform must be extended for each protocol: to 23 for extended and five for quad.
3. A Write Nonvolatile Configuration Register operation requires data being sent starting from the least significant byte.

**Figure 32. SPI Flash Write-Register Timing**

17.5.3 Memory Fast-Read Timing

Figure 33 shows the SPI flash extended and quad memory fast-read timing.

**Note:** Regarding Figure 33:

1. 24-bit addressing is used, so  $A[MAX] = A[23]$  and  $A[MIN] = A[0]$ .
2. For an extended SPI protocol,  $C_x = 7 + (A[MAX] + 1)$ .
3. For a quad SPI protocol,  $C_x = 1 + (A[MAX] + 1)/4$ .

**Figure 33. Memory Fast-Read Timing**

17.5.4 Memory-Write Timing

Figure 34 shows the SPI flash extended and quad memory-write (Page Program) timing.

**Note:** Regarding Figure 34:

1. For an extended SPI protocol,  $C_x = 7 + (A[MAX] + 1)$ .
2. For a quad SPI protocol,  $C_x = 1 + (A[MAX] + 1)/4$ .

**Figure 34. Memory-Write Timing**

17.5.5 SPI Flash Parameters

The combination of Figure 35 and Table 53 provide the SPI flash timing parameters.

Figure 35. SPI Flash Timing Parameters Diagram

Table 53. SPI Flash Timing Parameters

Parameter	Description	Minimum	Maximum	Units
$T_{DVCH}$	Data setup time	2	-	ns
$T_{CHDX}$	Data hold time	3	-	ns
$T_{CLQX}$	Output hold time	1	-	ns
$T_{CLQV}$	Output valid time (with a 10 pF load)	-	5	ns

**17.6 USB PHY Electrical Characteristics and Timing**

*17.6.1 USB 2.0 and USB 1.1 Electrical and Timing Parameters*

Table 54 provides electrical and timing parameters for USB 2.0.

**Table 54. USB 2.0 Electrical and Timing Parameters**

Parameter	Symbol	Minimum	Typical	Maximum	Units	Conditions
Baud rate	B <sub>PS</sub>	–	480	–	Mbps	–
Unit interval	UI	–	2083	–	ps	–
<b>Receiver – HS Mode</b>						
Differential input voltage sensitivity	V <sub>HSDI</sub>	300	–	–	mV	Static   V <sub>IDP</sub> – V <sub>IDN</sub>
Input common mode voltage range	V <sub>HSCM</sub>	–50	–	500	mV	–
Receiver jitter tolerance	ΔT <sub>HSRX</sub>	–0.15	–	0.15	UI	–
Input impedance	R <sub>IN</sub>	40.5	45	49.5	Ω	Single ended
<b>Transmitter – HS Mode</b>						
Output high voltage	V <sub>HSHO</sub>	360	400	440	mV	Static condition
Output low voltage	V <sub>HSHL</sub>	–10	0	10	mV	Static condition
Output rise time	T <sub>HSHR</sub>	500	–	–	ps	10% to 90%
Output fall time	T <sub>HSHF</sub>	500	–	–	ps	90% to 10%
Transmitter jitter	ΔT <sub>HSHTX</sub>	–0.05	–	0.05	UI	Transmit output jitter
Output impedance	R <sub>O</sub>	40.5	45	49.5	Ω	Single ended
Chirp-J output voltage (differential)	V <sub>CHIRPJ</sub>	700	–	1100	mV	HS termination disabled. 1.5 kΩ ± 5% pull-up resistor connected.
Chirp-K output voltage (differential)	V <sub>CHIRPK</sub>	–900	–	–500	mV	HS termination disabled. 1.5 kΩ ± 5% pull-up resistor connected.

**Note:** Refer to Section 7 of the USB 2.0 specification (www.usb.org) for more information on the receiver eye diagram template.

Table 55 provides electrical and timing parameters for USB 1.1.

**Table 55. USB 1.1 FS/LS Electrical and Timing Parameters <sup>a</sup>**

Parameter	Symbol	Value			Unit	Condition
		Minimum	Typical	Maximum		
<b>Baud Rate</b>						
FS	B <sub>PS</sub>	–	12	–	Mbps	–
LS	B <sub>PS</sub>	–	1.5	–	Mbps	–
<b>Unit Interval</b>						
FS	UI	–	83.33	–	ns	–
LS	UI	–	666.67	–	ns	–
<b>Receiver</b>						
Differential input sensitivity	V <sub>FSDI</sub>	200	–	–	mV	Static   V <sub>IDP</sub> – V <sub>IDN</sub>
Input common mode range	V <sub>FSCM</sub>	0.8	–	2.5	V	–
Input impedance	Z <sub>IN</sub>	300	–	–	kΩ	–
Input high voltage	V <sub>FSIH</sub>	2.0	–	–	V	Static
Input low voltage	V <sub>FSIL</sub>	–	–	0.8	V	Static

**Table 55. USB 1.1 FS/LS Electrical and Timing Parameters (Cont.)<sup>a</sup>**

Parameter	Symbol	Value			Unit	Condition
		Minimum	Typical	Maximum		
<b>Transmitter</b>						
Output high voltage	$V_{FSOH}$	2.8	–	–	V	Static
Output low voltage	$V_{FSOL}$	–	–	0.3	V	Static
Output rise/fall time for fast speed	$T_R, T_F$	4	–	20	ns	10 to 90%
Output rise/fall time for low speed	$T_R, T_F$	75	–	300	ns	10 to 90%
Fast-speed jitter	$\Delta\tau_{FSTX}$	–2	–	2	ns	–
Low-speed jitter	$\Delta\tau_{LSTX}$	–25	–	25	ns	–
Output impedance	$R_O$	28	–	44	$\Omega$	Single ended

a. For more details, refer to the *USB 1.1 Specification*.

17.6.2 USB 2.0 Timing Diagrams

Figure 36 shows the important timing parameters associated with a post-reset transition to high-speed (HS) operation.

**Figure 36. USB 2.0 Bus Reset to High-Speed Mode Operation**

Figure 37 shows the USB 2.0 HS Mode transmit timing.

**Figure 37. USB 2.0 High-Speed Mode Transmit Timing**

Figure 38 shows the USB 2.0 HS Mode receive timing.

**Figure 38. USB 2.0 High-Speed Mode Receive Timing**

## 18. Power-Up Sequence and Timing

### 18.1 Sequencing of Reset and Regulator Control Signals

The CYW43907 has two signals that allow the host to control power consumption by enabling or disabling the internal regulator blocks. These signals are described below. Additionally, diagrams are provided to indicate proper sequencing of the signals for various operational states (see [Figure 39](#) and [Figure 40](#)). The timing values indicated are minimum required values; longer delays are also acceptable.

#### 18.1.1 Description of Control Signals

- **REG\_ON**: Used by the PMU to power-up the CYW43907. It controls the internal CYW43907 regulators. When this pin is high, the regulators are enabled and the device is out of reset. When this pin is low the regulators are disabled.
- **HIB\_REG\_ON\_IN**: Used by the Hibernation (HIB) block to power up the internal CYW43907 regulators. If the HIB\_REG\_ON\_IN pin is low, the regulators are disabled. For the HIB\_REG\_ON\_IN pin to work as designed, HIB\_REG\_ON\_OUT must be connected to REG\_ON.

**Note:** The CYW43907 has an internal power-on reset (POR) circuit. The device will be held in reset for a maximum of 110 ms after VDDC and VDDIO have both passed the POR threshold.

**Note:** The 10%–90% VBAT rise time should not be faster than 40 microseconds. VBAT should be up before or at the same time as VDDIO. VDDIO should not be present first or be held high before VBAT is high.

#### 18.1.2 Control Signal Timing Diagrams

Figure 39. REG\_ON = High, No HIB\_REG\_ON\_OUT Connection to REG\_ON

Figure 40. HIB\_REG\_ON\_IN = High, HIB\_REG\_ON\_OUT Connected to REG\_ON

## 19. Thermal Information

### 19.1 Package Thermal Characteristics

**Table 56. Package Thermal Characteristics<sup>a</sup>**

Characteristic	WLCSP
$\theta_{JA}$ (°C/W) (value in still air)	33.74
$\theta_{JB}$ (°C/W)	5.5
$\theta_{JC}$ (°C/W)	1.74
$\psi_{JT}$ (°C/W)	5.86
$\psi_{JB}$ (°C/W)	11.52
Maximum Junction Temperature $T_j$ (°C)	116.7
Maximum power dissipation (W)	1.38

a. No heat sink,  $T_A = 70^\circ\text{C}$ . This is an estimate based on a 4-layer PCB that conforms to EIA/JESD51-7. Air velocity is 0 m/s.

### 19.2 Junction Temperature Estimation and $\psi_{JT}$ Versus $\theta_{JC}$

Package thermal characterization parameter  $\psi_{JT}$  yields a better estimation of actual junction temperature ( $T_j$ ) versus using the junction-to-case thermal resistance parameter  $\theta_{JC}$ . The reason for this is that  $\theta_{JC}$  assumes that all the power is dissipated through the top surface of the package case. In actual applications, some of the power is dissipated through the bottom and sides of the package.  $\psi_{JT}$  takes into account power dissipated through the top, bottom, and sides of the package. The equation for calculating the device junction temperature is:

$$T_j = T_T + P \times \psi_{JT}$$

Where:

- $T_j$  = Junction temperature at steady-state condition (°C)
- $T_T$  = Package case top center temperature at steady-state condition (°C)
- $P$  = Device power dissipation (Watts)
- $\psi_{JT}$  = Package thermal characteristics; no airflow (°C/W)

### 19.3 Environmental Characteristics

For environmental characteristics data, see [Table 17: "Environmental Ratings"](#).

20. Mechanical Information

Figure 41. WLCSP Package

## 21. Ordering Information

Part Number	Package	Description	Operating Ambient Temperature
CYW43907KWBG	4.583 mm x 5.533 mm, 316-pin WLCSP	–	–30°C to +85°C

## 22. Additional Information

### 22.1 Acronyms and Abbreviations

In most cases, acronyms and abbreviations are defined upon first use. For a more complete list of acronyms and other terms used in Cypress documents, go to: <http://www.cypress.com/glossary>.

### 22.2 References

The references in this section may be used in conjunction with this document.

**Note:** Cypress provides customer access to technical documentation and software through its Customer Support Portal (CSP) and Downloads and Support site (see [IoT Resources](#)).

Document (or Item) Name	Number	Source
1. USB 2.0 specification	–	<a href="http://www.usb.org">www.usb.org</a>
2. USB 1.1 Specification	–	<a href="http://www.usb.org">www.usb.org</a>

### 22.3 IoT Resources

Cypress provides a wealth of data at <http://www.cypress.com/internet-things-iot> to help you to select the right IoT device for your design, and quickly and effectively integrate the device into your design. Cypress provides customer access to a wide range of information, including technical documentation, schematic diagrams, product bill of materials, PCB layout information, and software updates. Customers can acquire technical documentation and software from the Cypress Support Community website (<https://community.cypress.com/>)

### 22.4 Errata

- The RTC block has been deprecated from this datasheet in revision \*A and later. This block is used by Cypress for internal testing/validation/verification and is not intended for customers to use.
- The details of the SPI hardware blocks were missing from this datasheet till revision \*H. Revision \*I adds this in section 5.12.SPI Note that the SPI hardware blocks can only support a hold time of 25ns and a fixed SPI mode (CPHA=0, CPOL = 0). For slaves that require higher hold times or a different mode a bit banging based SPI driver is recommended.
- The clock for the SPI Flash block needs to be constrained to ~26.67MHz for reliable operation at high operating temperatures. The throughput of the SPI Flash block is therefore restricted to ~13 MBps for Quad mode and ~3 MBps for single mode.
