4-Mbit (256K × 16) Static RAM

Features

- Pin-and function-compatible with CY7C1041B
- High speed
  - t_{AA} = 10 ns
- Low active power
  - I_{CC} = 90 mA at 10 ns (Industrial)
- Low CMOS standby power
  - I_{SB2} = 10 mA
- 2.0 V data retention
- Automatic power-down when deselected
- TTL-compatible inputs and outputs
- Easy memory expansion with $\overline{CE}$ and $\overline{OE}$ features
- Available in Pb-free 44-pin (400 Mils) Molded SOJ and 44-pin TSOP II packages

Functional Description

The CY7C1041D[1] is a high-performance CMOS static RAM organized as 256K words by 16 bits. Writing to the device is accomplished by taking Chip Enable ($\overline{CE}$) and Write Enable ($\overline{WE}$) inputs LOW. If Byte Low Enable ($\overline{BLE}$) is LOW, then data from I/O pins (I/O$_0$ through I/O$_7$), is written into the location specified on the address pins (A$_0$ through A$_{17}$). If Byte High Enable ($\overline{BHE}$) is LOW, then data from I/O pins (I/O$_8$ through I/O$_{15}$) is written into the location specified on the address pins (A$_0$ through A$_{17}$).

Reading from the device is accomplished by taking Chip Enable ($\overline{CE}$) and Output Enable ($\overline{OE}$) LOW while forcing the Write Enable ($\overline{WE}$) HIGH. If Byte Low Enable ($\overline{BLE}$) is LOW, then data from the memory location specified by the address pins will appear on I/O$_0$ to I/O$_7$. If Byte High Enable ($\overline{BHE}$) is LOW, then data from memory will appear on I/O$_8$ to I/O$_{15}$. See the truth table at the back of this data sheet for a complete description of read and write modes.

The input/output pins (I/O$_0$ through I/O$_{15}$) are placed in a high-impedance state when the device is deselected ($\overline{CE}$ HIGH), the outputs are disabled ($\overline{OE}$ HIGH), the $\overline{BHE}$ and $\overline{BLE}$ are disabled ($\overline{BHE}$, $\overline{BLE}$ HIGH), or during a write operation ($\overline{CE}$ LOW, and $\overline{WE}$ LOW).

The CY7C1041D is available in a standard 44-pin 400-mil-wide body width SOJ and 44-pin TSOP II package with center power and ground (revolutionary) pinout.

The CY7C1041D is suitable for interfacing with processors that have TTL I/P levels. It is not suitable for processors that require CMOS I/P levels. Please see Electrical Characteristics on page 4 for more details and suggested alternatives.

Notes
10. AC characteristics (except High-Z) are tested using the load conditions shown in Figure 2 (a). High-Z characteristics are tested for all speeds using the test load shown in Figure 2 (c).
11. Test conditions assume signal transition time of 3 ns or less, timing reference levels of 1.5 V, input pulse levels of 0 to 3.0 V, and output loading of the specified I_{OL}/I_{OH} and 30-pF load capacitance.
12. t_{POWER} gives the minimum amount of time that the power supply should be at typical V_{CC} values until the first memory access can be performed.
13. t_{HZOE}, t_{HZCE}, t_{HZBE}, and t_{HZWE} are specified with a load capacitance of 5 pF as in part (c) of Figure 2. Transition is measured when the outputs enter a high impedance state.
14. At any given temperature and voltage condition, t_{HZCE} is less than t_{LZCE}, t_{HZOE} is less than t_{LZOE}, t_{HZBE} is less than t_{LZBE}, and t_{HZWE} is less than t_{LZWE} for any given device.
15. The internal Write time of the memory is defined by the overlap of $\overline{CE}$ LOW, and $\overline{WE}$ LOW. $\overline{CE}$ and $\overline{WE}$ must be LOW to initiate a Write, and the transition of either of these signals can terminate the Write. The input data set-up and hold timing should be referenced to the leading edge of the signal that terminates the Write.
16. The minimum Write cycle time for Write Cycle No. 4 ($\overline{WE}$ Controlled, $\overline{OE}$ LOW) is the sum of t_{HZWE} and t_{SD}.

Switching Waveforms

**Figure 4. Read Cycle No. 1** [17, 18]

Figure 5. Read Cycle No. 2 ($\overline{OE}$ Controlled) [19, 20]

Notes

17. No input may exceed V_{CC} + 0.5 V.

18. Device is continuously selected. $\overline{OE}$, $\overline{CE}$, $\overline{BHE}$, and/or $\overline{BHE}$ = V_{IL}.

19. $\overline{WE}$ is HIGH for read cycle.

20. Address valid prior to or coincident with $\overline{CE}$ transition LOW.

Notes
21. Data I/O is high impedance if $\overline{OE}$ or $\overline{BHE}$ and/or $\overline{BLE}$= V_{IH}.

22. If $\overline{CE}$ goes HIGH simultaneously with $\overline{WE}$ going HIGH, the output remains in a high-impedance state.

Switching Waveforms(continued)

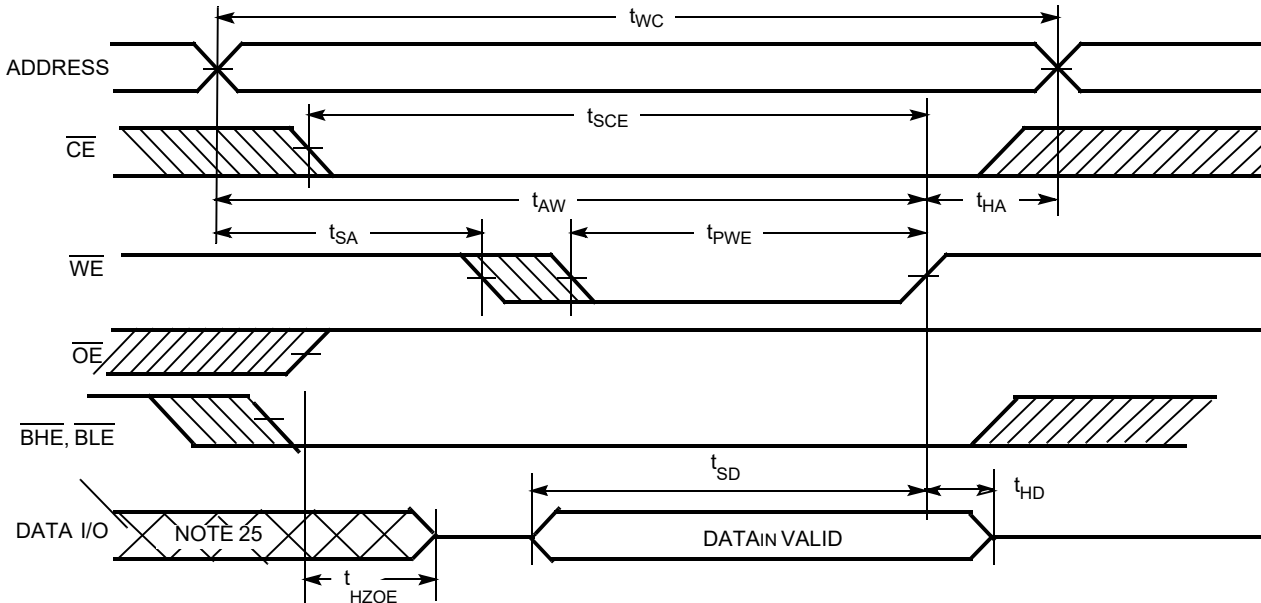

Figure 9. Write Cycle No. 4 ($\overline{WE}$ Controlled, $\overline{OE}$ LOW) [26]
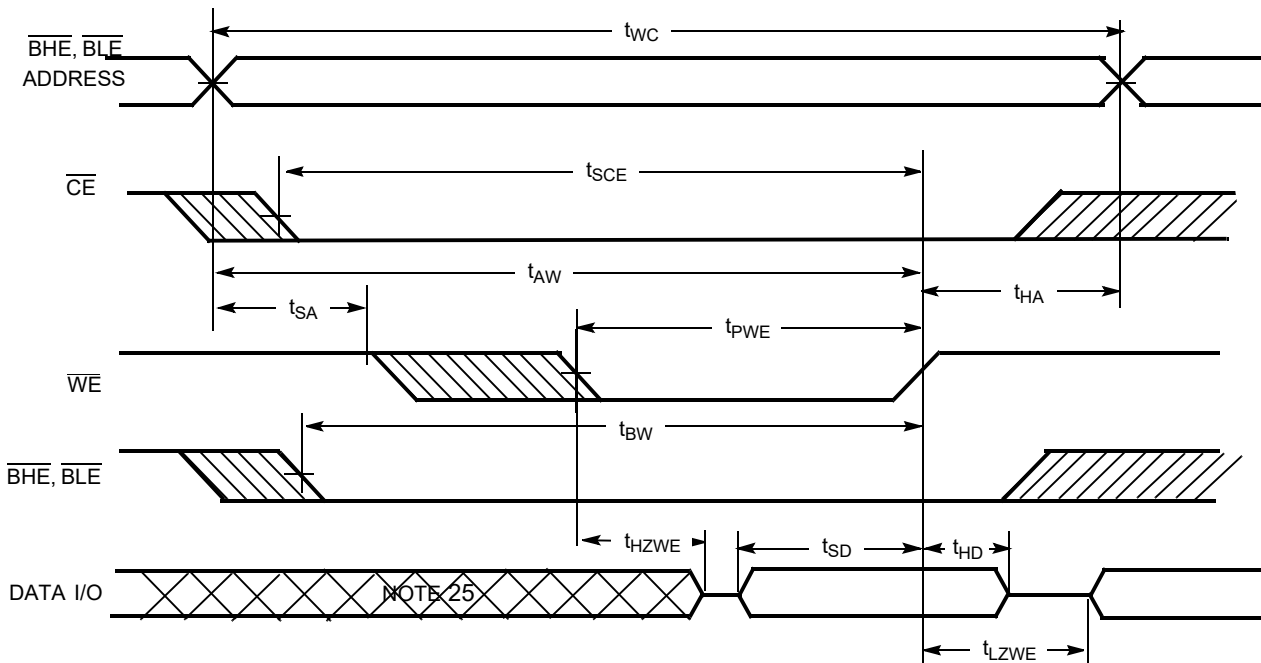

Notes

23. Address valid prior to or coincident with $\overline{CE}$ transition LOW.

24. Data I/O is high impedance if $\overline{OE}$ or $\overline{BHE}$ and/or $\overline{BLE}$ = V_{IH}.

25. During this period the I/Os are in the output state and input signals should not be applied.

26. The minimum Write cycle time for Write Cycle No. 4 ($\overline{WE}$ Controlled, $\overline{OE}$ LOW) is the sum of t_{HZWE} and t_{SD}.
