

FEATURES

- Four 10-bit ADCs
- 10-bit high dynamic range processing
- 12-channel analog input mux
- 10-bit deep color processing
- Analog monitor output
- NTSC/PAL/SECAM color standards support
- NTSC/PAL 3D comb filter
- 3D digital noise reduction (DNR)
- Advanced time base correction (TBC) with frame synchronization
- Interlaced-to-progressive conversion for 525i and 625i
- Advanced VBI data slicer, including Teletext, CC, and V-chip
- IF compensation filter
- SCART fast blank support including slow switch detect
- Programmable internal antialias filters
- Weak, poor time base, and nonstandard signal support
- Vertical peaking, horizontal peaking, CTI, LTI
- Simultaneous interlaced and progressive parallel output for 525i/525p and 625i/625p
- 525p/625p component progressive scan support
- 720p/1080i/1080p component HDTV support
- Digitizes RGB graphics with maximum pixel clock rate of 150 MHz (150 MHz speed grade only)
- 24-bit digital input port supports data from DVI/HDMI Rx IC
- Any-to-any, advanced 3 × 3 color space conversion matrix
- Flexible output pixel interface supporting 8-/10-/16-/20-/24-/30-bit SDR/DDR 4:2:2/4:4:4 data formats
- Programmable interrupt request output pin

APPLICATIONS

- AV receivers
- LCD HDTVs
- PDP HDTVs
- CRT HDTVs
- HDTV STBs with PVR
- DVD recorders with progressive scan input support
- Projectors

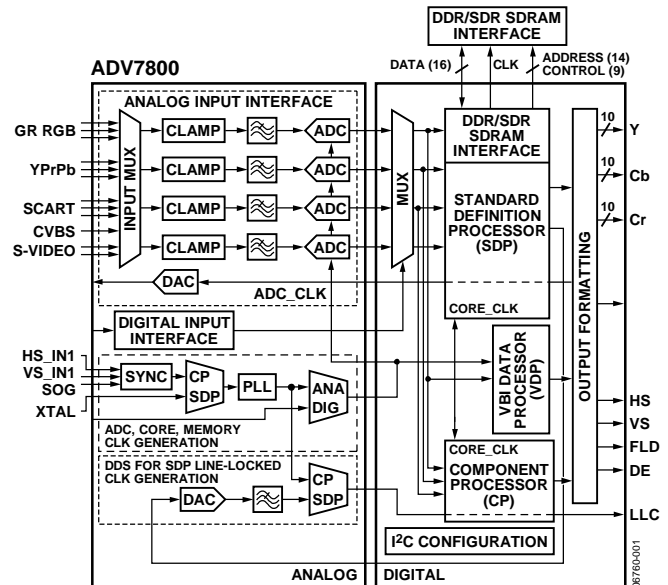

Figure 1. Simplified Functional Block Diagram

GENERAL DESCRIPTION

The ADV7800¹ is a high quality, single-chip, multiformat 3D comb filter, video decoder, and graphics digitizer. This multiformat 3D comb filter decoder supports the conversion of PAL, NTSC, and SECAM standards in the form of a composite or an S-Video into a digital ITU-R BT.656 format. The ADV7800 also supports the decoding of a component RGB/YPrPb video signal into a digital YCrCb or RGB pixel output stream.

The support for component video includes standards such as 525i, 625i, 525p, 625p, 720p, 1080i, 1080p, and many other HD and SMPTE standards. Graphics digitization is supported by the ADV7800; it is capable of digitizing RGB graphics signals from VGA to SXGA rates and converting them into a digital RGB or YCrCb pixel output stream. SCART and overlay functionality are enabled by the ability of the ADV7800 to simultaneously process CVBS and standard definition RGB signals.

The ADV7800 contains two main processing sections. The first section is the standard definition processor (SDP), which processes all PAL, NTSC, SECAM, and component (up to 525p/625p) signal types. The second section is the component processor (CP), which processes YPrPb and RGB component formats, including RGB graphics.

Large Clamp Sink Current	SDP only		0.9		mA
Fine Clamp Source Current	SDP only		17		μA
Fine Clamp Sink Current	SDP only		17		μA

¹ The minimum/maximum specifications are guaranteed over 0°C to 85°C .

² Guaranteed by characterization.

³ Except Pin 90 (FB).

ABSOLUTE MAXIMUM RATINGS

Table 5.

Parameter	Rating
AVDD to AGND	4.0 V
DVDD to DGND	2.2 V
PVDD to AGND	2.2 V
DVDDIO to DGND	4.0 V
DVDDIO_SDRAM to DGND_SDRAM (DDR)	2.7 V
DVDDIO_SDRAM to DGND_SDRAM (SDR)	4.0 V
DVDDIO to AVDD	-0.3 V to +0.3 V
DVDDIO to DVDD	-0.3 V to +2 V
DVDDIO_SDRAM to DVDD (DDR)	-0.3 V to +2.5 V
DVDDIO_SDRAM to DVDD (SDR)	-0.3 V to +3.3 V
AVDD to PVDD	-0.3 V to +2 V
AVDD to DVDD	-0.3 V to +2 V
DVDDIO to DVDDIO_SDRAM (DDR)	-0.3 V to +2 V
DVDDIO to DVDDIO_SDRAM (SDR)	-0.3 V to +3.3 V
AVDD to DVDDIO_SDRAM (DDR)	-0.3 V to +2.5 V
AVDD to DVDDIO_SDRAM (SDR)	-0.3 V to +1.8 V
Digital Inputs Voltage to DGND	DGND - 0.3 V to DVDDIO + 0.3 V
DVDDIO_SDRAM Inputs to DGND_SDRAM	DGND_SDRAM - 0.3 V to DVDDIO_SDRAM + 0.3 V
Analog Inputs to AGND	AGND - 0.3 V to AVDD + 0.3 V
SCLK/SDA Data Pins to DVDDIO	DVDDIO - 0.3 V to DVDDIO + 3.6 V
Maximum Junction Temperature (T _{J MAX})	125°C
Storage Temperature Range	-65°C to +150°C
Infrared Reflow Soldering (20 sec)	260°C

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

PACKAGE THERMAL PERFORMANCE

To reduce power consumption when using the part, the user is advised to turn off any unused ADCs.

The junction temperature must always stay below the maximum junction temperature (T_{J MAX}) of 125°C. This equation shows how to calculate the junction temperature:

$$T_J = T_{A MAX} + (\theta_{JA} \times W_{MAX})$$

where:

$$T_{A MAX} = 85^\circ\text{C}$$

$$\theta_{JA} = 21.0330^\circ\text{C/W}$$

$$W_{MAX} = ((AVDD \times I_{AVDD}) + (DVDD \times I_{DVDD}) + (DVDDIO \times I_{DVDDIO}) + (PVDD \times I_{PVDD}) + (DVDD_SDRAM \times I_{DVDD_SDRAM})).$$

THERMAL RESISTANCE

θ_{JA} is specified for the worst-case conditions, that is, a device soldered in a circuit board for surface-mount packages.

Table 6. Thermal Resistance

Package Type	θ_{JA} ¹	θ_{JC} ²	Unit
176-Lead LQFP	21	7	°C/W

¹ 4-layer PCB with solid ground plane.

² 4-layer PCB with solid ground plane (still air).

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

Figure 7. Pin Configuration

06760-003

Table 7. Pin Function Descriptions

Pin No.	Mnemonic	Type ¹	Description
1 to 14, 155 to 158, 161 to 169, 172 to 174	P0 to P29	O	Video Pixel Output Port. See Figure 7 for details on pin mapping.
15, 79, 143, 170	DVDDIO	P	Digital Input/Output Supply Voltage (3.3 V).
16, 22, 35, 59, 77, 82, 138, 144, 160, 171, 176	DGND	GND	Digital Ground.
17	LLC	O	Line-Locked Output Clock for the Pixel Data.
18	CS/HS_OUT	O	Horizontal Synchronization or Composite Synchronization Signal. This signal can be selected while in SDP mode.
19	SFL/SYNC_OUT	O	Subcarrier Frequency Lock. This pin contains a serial output stream, which can be used to lock the subcarrier frequency when this decoder is connected to any digital video encoder from Analog Devices, Inc. SYNC_OUT is the sliced synchronization output signal available only in CP mode.
20	FLD_DE_OUT	O	Field Synchronization Output Signal (All Interlaced Video Modes). This pin can also be enabled as a data enable signal (DE) to allow direct connection to a HDMI™/DVI Tx IC.
21	VS_OUT	O	Vertical Synchronization Output Signal (SDP and CP modes).
23, 36, 60, 76, 137, 159, 175	DVDD	P	Digital Core Supply Voltage (1.8 V).
24 to 34, 39	SDRAM_A0 to SDRAM_A11	O	Address Outputs. Interface to external RAM address lines. See Figure 7 for details on pin mapping.
37, 47, 61	DVDDIO_SDRAM	P	External Memory Interface Digital Input/Output Supply (2.5 V for DDR, or 3.3 V for SDR).
38, 48, 62	DGND_SDRAM	GND	External Memory Interface Digital GND.
40, 41	SDRAM_BA1, SDRAM_BA0	O	Bank Address Outputs. Interface to external RAM bank address lines.
42	SDRAM_CS	O	<u>SDRAM_CS</u> is a chip select function that enables and disables the command decoder on the RAM.
43	SDRAM_RAS	O	<u>Row Address Select Command Signal</u> . <u>SDRAM_RAS</u> , <u>SDRAM_CAS</u> , <u>SDRAM_WE</u> , and <u>SDRAM_CS</u> define the command to the RAM.
44	SDRAM_CAS	O	<u>Column Address Select Command Signal</u> . <u>SDRAM_RAS</u> , <u>SDRAM_CAS</u> , <u>SDRAM_WE</u> , and <u>SDRAM_CS</u> define the command to the RAM.
45	SDRAM_WE	O	<u>Write Enable Output Command Signal</u> . <u>SDRAM_RAS</u> , <u>SDRAM_CAS</u> , <u>SDRAM_WE</u> , and <u>SDRAM_CS</u> define the command to the RAM.
46, 72	SDRAM_LDM, SDRAM_UDM	O	Data Mask Output. Data is masked when DM is high, for write data to the external RAM. LDM corresponds to the data on SDRAM_DQ0 to SDRAM_DQ7, and UDM corresponds to the data on SDRAM_DQ8 to SDRAM_DQ15.
49	SDRAM_LDQS	I/O	Lower Data Strobe Pin. Data strobe pins are used for the RAM interface. This is an output with read data and an input with write data. It is edge aligned with write data and centered in read data. SDRAM_LDQS corresponds to the data on SDRAM_DQ0 to SDRAM_DQ7.
50 to 57, 63 to 70	SDRAM_DQ0 to SDRAM_DQ15	I/O	Data Bus. Interface to external RAM 16-bit data bus. See Figure 7 for details on pin mapping.
58	SDRAM_VREF	P	1.25 V reference for DDR SDRAM interface or 1.65 V for SDR SDRAM interface.
71	SDRAM_UDQS	I/O	Upper Data Strobe Pin. Data strobe pins for the RAM interface. This is an output with read data and an input with write data. It is edge aligned with write data and centered in read data. SDRAM_UDQS corresponds to the data on SDRAM_DQ8 to SDRAM_DQ16.
73, 74	SDRAM_CK, SDRAM_CK	O	Differential Clock Output. All address and control output signals to the RAM should be sampled on the positive edge of SDRAM_CK and on the negative edge of <u>SDRAM_CK</u> .
75	SDRAM_CKE	O	Clock Enable. This pin is used to enable the clock signals of the external RAM.
78	CLKIN	I	Clock Input Signal. Used in 24-bit digital input mode (for example, processing 24-bit RGB data from a DVI/HDMI Rx IC) and also in digital CVBS input mode.

Pin No.	Mnemonic	Type ¹	Description
80	XTAL	I	Crystal Input. Input pin for 28.63636 MHz crystal.
81	XTAL1	O	Crystal Output. This pin should be connected to the 28.63636 MHz crystal.
83	RESET	I	System Reset Input. Active low. A minimum low reset pulse width of 5 ms is required to reset the ADV7800 circuitry.
84, 87	PVDD	P	PLL Supply Voltage (1.8 V).
85, 89, 99, 100, 104	AGND	GND	Analog Ground.
86, 88	ELPF1, ELPF2	I	External Loop Filter. The recommend external loop filter must be connected to each ELPF pin (see Figure 8).
90	FB	I	SCART Fast Blank Input.
91	SOY	I	Sync On Luma Input. Used in embedded synchronization mode.
92	SOG	I	Sync On Green Input. Used in embedded synchronization mode.
93 to 98, 110 to 115	AIN1 to AIN12	I	Analog Video Input Channels. See Figure 7 for details on pin mapping.
101, 105	AVDD	P	Analog Supply Voltage (3.3 V).
102	REFOUT	O	Internal Voltage Reference Output.
103	CML	O	Common-Mode Level Pin Used for the Internal ADCs.
106	BIAS	O	External Bias Setting Pin. Connect the recommended resistor (1.35 kΩ) between the pin and ground.
107	CAPY1	I	ADC Capacitor Network.
108, 109	CAPC1, CAPC2	I	ADC Capacitor Network.
116	AOUT	O	Analog Monitor Output.
117	FUNCT1	I	SCART Function Select Input.
118	HS_IN1	I	Horizontal Synchronization Input Signal. Used in CP mode for 5-wire timing mode.
119	HS_IN2	I/O	Horizontal Synchronization Input Signal. Used in 24-bit digital input mode port mode (for example, processing 24-bit RGB data from an HDMI Rx IC). HS_IN2 in conjunction with VS_IN2 can be configured as a fast I ² C interface for teletext data extraction. HS_IN2 is used as the I ² C port serial clock input.
120	ALSB	I	ALSB selects the I ² C address for the ADV7800 control. ALSB set to Logic 0 configures the address for a write to the input/output port of 0x40. ALSB set to Logic 1 configures the address for a write to the input/output port of 0x42.
121	SDA	I/O	I ² C Port Serial Data Input/Output Pin.
122	SCLK	I	I ² C Port Serial Clock Input (Maximum Clock Rate of 400 kHz).
123	INT	O	Interrupt Output. This pin can be active low or active high. When SDP/CP status bits change, this pin triggers. The set of events that triggers an interrupt is under user control.
124	VS_IN2	I/O	Vertical Synchronization Input Signal. Used in 24-bit digital input mode (for example, processing 24-bit RGB data from an DVI/HDMI Rx IC). VS_IN2 in conjunction with HS_IN2 can be configured as a fast I ² C interface for teletext data extraction. VS_IN2 is used as the I ² C port serial data input/output pins.
125	VS_IN1	I	Vertical Synchronization Input Signal.
126	DE_IN	I	Data Enable Input Signal. Used in 24-bit digital input port mode (for example, processing 24-bit RGB data from an DVI/HDMI Rx IC).
127 to 136, 139 to 142, 145 to 154	P30 to P53	I/O	Video Pixel Input/Output Port. See Figure 7 for details on pin mapping.

¹ GND = ground, I = input, I/O = input/output, O = output, P = power.

THEORY OF OPERATION

KEY FEATURES

The ADV7800 is a high quality, single-chip, multiformat 3D comb filter video decoder, and graphics digitizer. Key features of the device include

- Four 10-bit ADCs
- NTSC/PAL/SECAM video decoder
- Adaptive 3D comb filtering
- 3D digital noise reduction
- Advanced frame time-base correction (TBC)
- Composite, S-Video, YPrPb/RGB SCART support
- YPrPb component HD and RGB graphics input support
- 30-bit digital YPrPb/RGB output supporting 10-bit deep color

ANALOG FRONT END

The ADV7800 analog front end comprises four 10-bit ADCs that digitize the analog video signal before applying it to the SDP or CP.

The front end includes a 12-channel input mux that enables multiple video signals to be applied to the ADV7800 without the requirement of an external mux. Current and voltage clamps are positioned in front of each ADC to ensure the video signal remains within the range of the converter.

The ADCs are configured to run up to 4× oversampling mode when decoding composite and S-Video inputs or components up to 525i and 625i. 2× oversampling is available for 525p and 625p. All other video standards are 1× oversampled. In oversampling the video signals, a reduction in the cost and complexity of external antialiasing filters can be obtained with the benefit of an increased signal-to-noise ratio (SNR).

Optional internal antialiasing filters with programmable bandwidth are positioned in front of each ADC. These filters can be used to band-limit standard definition video signals, removing spurious, out-of-band noise.

The ADV7800 can support simultaneous processing of CVBS and RGB standard definition signals to enable SCART compatibility and overlay functionality. A combination of CVBS and RGB inputs can be mixed and can be output under the control of I²C registers and the fast blank pin.

Analog front-end features include

- Four 150 MHz, 10-bit ADCs that enable true 10-bit video decoding
- 12-channel analog input mux that enables multiple source connections without the requirement of an external mux
- Four current and voltage clamp control loops that ensure any dc offsets are removed from the video signal
- SCART functionality and SD RGB overlay on CVBS controlled by fast blank input
- SCART source switching detection through FUNCT1 input
- Four programmable antialias filters on standard definition video signals and enhance definition
- CVBS monitor output

STANDARD DEFINITION PROCESSOR

The standard definition processor (SDP) is capable of decoding a large selection of baseband video signals in composite, S-Video, and YUV formats. The video standards supported by the SDP include PAL, PAL 60, PAL M, PAL N, PAL NC, NTSC M/J, NTSC 4.43, and SECAM. The ADV7800 can automatically detect the video standard and process it accordingly. The ADV7800 can process video up to 525p/625p formats.

The SDP has a 3D temporal comb filter and a 5-line adaptive 2D comb filter that gives superior chrominance and luminance separation when decoding a composite video signal. This highly adaptive filter automatically adjusts its processing mode according to the video standard and signal quality with no user intervention required. The SDP has an IF filter block that compensates for attenuation in the high frequency chroma spectrum due to a tuner SAW filter. The SDP has specific luminance and chrominance parameter controls for brightness, contrast, saturation, and hue.

The ADV7800 implements a patented adaptive digital line length tracking (ADLLT) algorithm to track varying video line lengths from sources such as a VCR. ADLLT enables the ADV7800 to track and decode poor quality video sources (such as VCRs) and noisy sources (such as tuner outputs, VCRs, and camcorders). Frame TBC ensures stable clock synchronization between the decoder and the downstream devices to prevent disruptions.

The SDP also contains both a luma transient improvement (LTI) and a chroma transient improvement (CTI) processor. This processor increases the edge rate on the luma and chroma transitions, resulting in a sharper video image.

The SDP has a Macrovision® detection circuit, which allows Type I, Type II, and Type III Macrovision protection levels. The decoder is also fully robust to all Macrovision signal inputs.

SDP features include

- Full automatic detection and autoswitching of all worldwide standards (PAL, NTSC, and SECAM)
- Advanced adaptive 3D comb with concurrent 3D noise reduction (using either external DDR or SDR memory)
- Adaptive 2D 5-line comb filters for NTSC and PAL that give superior chrominance and luminance separation for composite video
- Automatic gain control with white peak mode that ensures the video is always processed without loss of the video processing range
- Proprietary architecture for locking to weak, noisy, and unstable sources from VCRs and tuners
- IF filter block that compensates for high frequency luma attenuation due to a tuner SAW filter
- LTI and CTI
- Vertical and horizontal programmable luma peaking filters
- 10-bit deep color processing path from front to back end in RGB/YCrCb formats
- Macrovision copy protection detection on composite and S-Video for all worldwide formats (PAL, NTSC, and SECAM)
- 4× oversampling (54 MHz) for CVBS, S-Video, and YUV modes
- 2× oversampling (54 MHz) for 525p and 625p modes
- Line-locked clock output (LLC)
- Free run output mode that provides stable timing when no video input is present
- Internal color bar test pattern
- Advanced TBC with frame synchronization, which ensures nominal clock and data for nonstandard input
- Interlace-to-progressive conversion for 525i and 625i formats, enabling direct drive of HDMI Tx devices
- Color controls that include hue, brightness, saturation, and contrast
- Differential gain (DG), typically 0.45%
- Differential phase (DP), typically 0.45°
- Video SNR, typically 61 dB

VBI DATA PROCESSOR

The VBI data processor (VDP) of the ADV7800 is capable of slicing multiple vertical blanking interval data standards on SD video and component video. The VDP decodes the VBI data on the incoming CVBS/YC or YUV data processed by the SDP core. It can also decode VBI data on the luma channel of YUV data processed through the CP core.

The VDP can process a variety of VBI data services, such as

- Teletext
- Video programming system (VPS)
- Vertical interval time codes (VITC)
- Closed captioning (CC) and extended data service (EDS)
- Wide screen signaling (WSS)
- Copy generation management system (CGMS, CGMS Type B)
- Gemstar® 1×/2× electronic program guide compatible
- Extended data service (SDS); the data extracted can be read back over a fast I²C interface

COMPONENT PROCESSOR

The component processor (CP) is capable of decoding and digitizing a wide range of component video formats in any color space. The CP can accept video data from the analog front end or from the HDMI receiver. Component video standards supported by the CP include 525i, 625i, 525p, 625p, 720p, 1080i, 1080p, and VGA (up to SXGA at 75 Hz), and many other standards.

A fully programmable any-to-any, 3 × 3 color space conversion (CSC) matrix is placed before the CP. This enables YPrPb-to-RGB and RGB-to-YCrCb conversions of video data coming from the analog front end or from the HDMI receiver. Many other standards of color space can be implemented using the color space converter.

The CP of the ADV7800 contains an automatic gain control (AGC) block. The AGC is followed by a clamp circuit that ensures the video signal is clamped to the correct blanking level. Automatic adjustments within the CP include gain (contrast) and offset (brightness). Manual adjustment controls are also supported. In cases where no embedded synchronization is preset, the video gain can be set manually.

The CP contains circuitry to enable the detection of Macrovision encoded YPrPb signals for 525i, 625i, 525p, and 625p. It is designed to be fully robust to these types of signals.

CP features include

- 525i, 625i, 525p, 625p, 720p, 1080i, 1080p, and many other HDTV formats supported
- Automatic adjustments including gain (contrast) and offset (brightness); manual adjustment controls also supported
- Support for analog component YPrPb and RGB video formats with embedded synchronization or with separate HS, VS, or CS
- Any-to-any, 3×3 color space conversion matrix that supports YCrCb-to-RGB and RGB-to-YCrCb, fully programmable or preprogrammable configurations
- Synchronization source polarity detector (SSPD) that determines the source and polarity of the synchronization signals that accompany the input video
- Macrovision copy protection detection on component formats (525i, 625i, 525p, and 625p)
- Free run output mode that provides stable timing when no video input is present
- Arbitrary pixel sampling support for nonstandard video sources
- 150 MHz conversion rate, which supports RGB input resolutions up to 1280×1024 at 75 Hz
- Automatic or manual clamp-and-gain controls for graphics modes

- Contrast, brightness, hue, and saturation controls
- 32-phase DLL that allows optimum pixel clock sampling
- Automatic detection of synchronization source and polarity by SSPD block
- Standard identification enabled by STDI block
- RGB that can be color space converted to YCrCb and decimated to a 4:2:2 format for videocentric back-end IC interfacing
- DE output signal that is supplied for direct connection to HDMI/DVI Tx IC
- Arbitrary pixel sampling support for nonstandard video sources

ADDITIONAL FEATURES

The ADV7800 also includes

- HS, VS, FIELD, and DE output signals with programmable position, polarity, and width
- Programmable interrupt request output pin ($\overline{\text{INT}}$) that signals SDP/CP status changes
- Two I²C host port interface (control and VBI) support
- Integrated programmable antialiasing filters
- 176-lead, 26 mm \times 26 mm, RoHS-compliant LQFP

For more detailed product information about the ADV7800, email video.products@analog.com or contact a local Analog Devices sales representative.

EXTERNAL MEMORY REQUIREMENTS

SINGLE DATA RATE (SDR)

The ADV7800 uses SDR external memory for 3D comb, frame synchronizer operation, or 3D-DNR nonconcurrent operation.

- 64 Mb SDR SDRAM minimum memory requirement
- The memory architecture required is four banks of 1 Mb × 16 (4M16)
- Speed grade of 133 MHz at CAS latency (CL) 3 is required
- 22 Ω series termination resistors are recommended for this configuration
- Recommended memory that is compatible with the ADV7800 includes the MT48LC4M16A2 from Micron

DOUBLE DATA RATE (DDR)

The ADV7800 uses DDR external memory for simultaneous 3D comb, frame synchronizer, and 3D-DNR operation.

- 128 Mb DDR SDRAM minimum memory requirement
- The memory architecture required is four banks of 2 Mb × 16 (8M16)
- Speed grade of 133 MHz at CAS latency (CL) 2.5 is required
- Termination resistors not recommended for this configuration
- Recommended memory that is compatible with the ADV7800 includes K4H281638B-TCB0 from Samsung, the MT46V8M16-TGP-75 from Micron, and the HYB25D128160CE-6 from Infineon

RECOMMENDED EXTERNAL LOOP FILTER COMPONENTS

The external loop filter components for the ELPF pins should be placed as close as possible to the respective pins. Figure 8 shows the recommended component values.

Figure 8. ELPF Components

TYPICAL CONNECTION DIAGRAMS

Figure 9. Typical Connection Diagram (External DDR Memory)

PIXEL INPUT/OUTPUT FORMATTING

There are several modes in which the ADV7800 pixel port can be configured. These modes are under the I²C control of OP_FORMAT_SEL[5:0].

PIXEL DATA OUTPUT MODES HIGHLIGHTS

The ADV7800 has a flexible pixel port, which can be configured in a variety of formats to accommodate downstream ICs. See Table 8 and Table 9 for more information on each mode. The output pixel port features include

- 8-/10-bit ITU-R BT.656 4:2:2 YCrCb with embedded time codes and/or HS_OUT, VS_OUT, and FLD_DE_OUT pin timing
- 16-/20-/24-bit YCrCb with embedded time codes and/or HS_OUT, VS_OUT, and FLD_DE_OUT pin timing
- 24-/30-bit YCrCb/RGB with embedded time codes and/or HS_OUT, VS_OUT, and FLD_DE_OUT pin timing

- DDR 8-/10-bit 4:2:2 YCrCb for all standards
- DDR 24-/30-bit 4:4:4 RGB for all standards
- Simultaneous output modes 16-/20-bit YCrCb and 8-/10-bit 4:2:2 YCrCb up to 525i/525p and 625i/625p

DIGITAL VIDEO INPUT PORT HIGHLIGHTS

The ADV7800 contains a 24-bit digital input port. Main features are as follows:

- Support for 24-bit RGB input data from the DVI/HDMI Rx IC, pass-through, or output converted to 4:2:2 YCrCb
- Support for 24-bit 4:4:4, 16-/20-bit 4:2:2 525i, 625i, 525p, 625p, 1080i, 720p, 1080p, and VGA to SXGA at 75 Hz input data from the DVI/HDMI Rx IC chip, pass-through, or output converted to 4:2:2 YCrCb
- Dedicated synchronization and pixel port inputs
