

## Please note that Cypress is an Infineon Technologies Company.

The document following this cover page is marked as "Cypress" document as this is the company that originally developed the product. Please note that Infineon will continue to offer the product to new and existing customers as part of the Infineon product portfolio.

## **Continuity of document content**

The fact that Infineon offers the following product as part of the Infineon product portfolio does not lead to any changes to this document. Future revisions will occur when appropriate, and any changes will be set out on the document history page.

## Continuity of ordering part numbers

Infineon continues to support existing part numbers. Please continue to use the ordering part numbers listed in the datasheet for ordering.

## CY7C1360C CY7C1362C

# 9-Mbit (256K × 36/512K × 18) Pipelined SRAM

### Features

- Supports bus operation up to 200 MHz
- Available speed grades: 200 MHz, and 166 MHz
- Registered inputs and outputs for pipelined operation
- 3.3 V core power supply (V<sub>DD</sub>)
- 2.5 V/3.3 V I/O operation (V<sub>DDQ</sub>)
- Fast clock-to-output times □ 3.0 ns (for 200 MHz device)
- Provide high performance 3-1-1-1 access rate
- User selectable burst counter supporting Intel<sup>®</sup> Pentium<sup>®</sup> interleaved or linear burst sequences
- Separate processor and controller address strobes
- Synchronous self-timed writes
- Asynchronous output enable
- Single cycle chip deselect
- Available in Pb-free 100-pin TQFP package, non Pb-free 119-ball BGA package, and 165-ball FBGA package
- TQFP available with 3-chip enable and 2-chip enable
- IEEE 1149.1 JTAG-compatible boundary scan

### **Functional Description**

The CY7C1360C/CY7C1362C SRAM integrates 256K × 36 and 512K × 18 SRAM cells with advanced synchronous peripheral circuitry and a two-bit counter for internal burst operation. All synchronous inputs are gated by registers controlled by a positive-edge-triggered clock input (CLK). The synchronous inputs include all addresses, all data inputs, address-pipelining chip enable (CE<sub>1</sub>), depth-expansion chip enables (CE<sub>2</sub> and CE<sub>3</sub><sup>[1]</sup>), burst control inputs (ADSC, ADSP, and ADV), write enables (BW<sub>X</sub>, and BWE), and global write (GW). Asynchronous inputs include the output enable (OE) and the ZZ pin.

Addresses and chip enables are registered at the rising edge of clock when either ad<u>dress</u> strobe processor (ADSP) or address strobe controller (ADSC) are active. Subsequent burst addresses can be internally generated as controlled by the advance pin (ADV).

Address, data inputs, and write controls are registered on-chip to initiate a self-timed write cycle. This part supports byte write operations (see Pin Definitions on page 8 and Truth Table on page 11 for further details). Write cycles can be one to two or <u>four</u> bytes wide as controlled by the byte write control inputs. GW when active LOW causes all bytes to be written.

The CY7C1360C/CY7C1362C operate from a +3.3 V core power supply while all outputs may operate with either a +2.5 or +3.3 V supply. All inputs and outputs are JEDEC-standard JESD8-5-compatible.

### **Selection Guide**

| Description                  | 200 MHz | 166 MHz | Unit |
|------------------------------|---------|---------|------|
| Maximum access time          | 3.0     | 3.5     | ns   |
| Maximum operating current    | 220     | 180     | mA   |
| Maximum CMOS standby current | 40      | 40      | mA   |

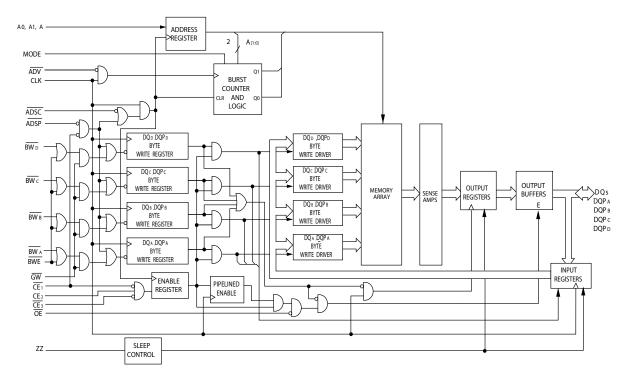

Note\_\_\_

1.  $\overline{\text{CE}}_3$  is for A version of TQFP (3 Chip Enable option) and 165-ball FBGA package only. 119-ball BGA is offered only in 2 Chip Enable.

CY7C1360C (256K × 36)

## **Pin Definitions**

| Name   | I/O                    | Description   |
|--|------------------------|---|
| A <sub>0</sub> , A <sub>1</sub> , A  | Input-<br>synchronous  | Address inputs used to select one of the address locations. Sampled at the rising edge of the CLK if ADSP or ADSC is active LOW, and $\overline{CE}_1$ , $CE_2$ , and $\overline{CE}_3^{[2]}$ are sampled active. A1:A0 are fed to the two-bit counter.   |
| <u>BW</u> <sub>A</sub> , <u>BW</u> <sub>B</sub> ,<br>BW <sub>C</sub> , BW <sub>D</sub> | Input-<br>synchronous  | Byte write select inputs, active LOW. Qualified with BWE to conduct byte writes to the SRAM. Sampled on the rising edge of CLK.   |
| GW   | Input-<br>synchronous  | <b>Global write enable input, active LOW</b> . When asserted LOW <u>on the rising edge of CLK</u> , a global write is conducted (all bytes are written, regardless of the values on $BW_X$ and $BWE$ ).   |
| BWE  | Input-<br>synchronous  | Byte write enable input, active LOW. Sampled on the rising edge of CLK. This signal must be asserted LOW to conduct a byte write.   |
| CLK  | Input-<br>clock        | <b>Clock input</b> . <u>Used</u> to capture all synchronous inputs to the device. Also used to increment the burst counter when ADV is asserted LOW, during a burst operation.  |
| CE <sub>1</sub>  | Input-<br>synchronous  | <b>Chip_enable 1 input, active LOW</b> . Sam <u>pled on</u> the rising edge of CLK. Used in conjunction with $CE_2$ and $CE_3^{[2]}$ to select/deselect the device. ADSP is ignored if $CE_1$ is HIGH. $CE_1$ is sampled only when a new external address is loaded.  |
| CE <sub>2</sub>  | Input-<br>synchronous  | <b>Chip enable 2 input, active HIGH</b> . Sampled on the rising edge of CLK. Used in conjunction with $\overline{CE}_1$ and $\overline{CE}_3^{[2]}$ to select/deselect the device. $CE_2$ is sampled only when a new external address is loaded.  |
| CE <sub>3</sub> <sup>[2]</sup>   | Input-<br>synchronous  | <b>Chip enable 3 input, active LOW</b> . Sampled on the rising edge of CLK. Used in conjunction with $\overline{CE}_1$ and $CE_2$ to select/deselect the device. Not available for AJ package version. Not connected for BGA. Where referenced, $\overline{CE}_3^{[2]}$ is assumed active throughout this document for BGA. $\overline{CE}_3$ is sampled only when a new external address is loaded.  |
| OE   | Input-<br>asynchronous | <b>Output enable, asynchronous input, active LOW</b> . Controls the direction of the I/O pins. When LOW, the I/ <u>O p</u> ins behave as outputs. When deasserted HIGH, I/O pins are tristated, and act as input data pins. OE is masked during the first clock of a read cycle when emerging from a deselected state.  |
| ADV  | Input-<br>synchronous  | Advance input signal, sampled on the rising edge of CLK, active LOW. When asserted, it automatically increments the address in a burst cycle.   |
| ADSP   | Input-<br>synchronous  | Address strobe from processor, sampled on the rising edge of CLK, active LOW. When asserted LOW, addresses presented to the device are captured in the address registers. A1:A0 are also loaded into the burst counter. When ADSP and ADSC are both asserted, only ADSP is recognized. ASDP is ignored when CE <sub>1</sub> is deasserted HIGH.   |
| ADSC   | Input-<br>synchronous  | Address strobe from controller, sampled on the rising edge of CLK, active LOW. When asserted LOW, addresses presented to the device are captured in the address registers. A1:A0 are also loaded into the burst counter. When ADSP and ADSC are both asserted, only ADSP is recognized.   |
| ZZ   | Input-<br>asynchronous | <b>ZZ "sleep" input, active HIGH</b> . When asserted HIGH places the device in a non-time-critical "sleep" condition with data integrity preserved. For normal operation, this pin has to be LOW or left floating. ZZ pin has an internal pull-down.  |
| DQs, DQP <sub>X</sub>  | I/O-<br>synchronous    | <b>Bidirectional data I/O lines</b> . As inputs, they feed into an on-chip data register that is triggered by the rising edge of CLK. As outputs, they deliver the data contained in the memory location specified by the addresses presented during the previous clock rise of the read cycle. The direction of the pins is controlled by OE. When OE is asserted LOW, the pins behave as outputs. When HIGH, DQs and DQP <sub>X</sub> are placed in a tristate condition. |
| V <sub>DD</sub>  | Power supply           | Power supply inputs to the core of the device.  |
| V <sub>SS</sub>  | Ground                 | Ground for the core of the device.  |
| V <sub>SSQ</sub>   | I/O ground             | Ground for the I/O circuitry.   |
| V <sub>DDQ</sub>   | I/O power<br>supply    | Power supply for the I/O circuitry.   |
| MODE   | Input-<br>static       | <b>Selects burst order</b> . When tied to GND selects linear burst sequence. When tied to $V_{DD}$ or left floating selects interleaved burst sequence. This is a strap pin and should remain static during device operation. Mode pin has an internal pull-up.   |

Note\_\_\_\_\_\_2. CE<sub>3</sub> is for A version of 100-pin TQFP (3 Chip Enable option) and 165-ball FBGA package only. 119-ball BGA is offered only in 2 Chip Enable.

### Pin Definitions (continued)

| Name  | I/O                                  | Description  |
|---|--------------------------------------|--|
| TDO   | JTAG serial<br>output<br>synchronous | Serial data-out to the JTAG circuit. Delivers data on the negative edge of TCK. If the JTAG feature is not being used, this pin should be disconnected. This pin is not available on TQFP packages.                      |
| TDI   | JTAG serial<br>input<br>synchronous  | Serial data-in to the JTAG circuit. Sampled on the rising edge of TCK. If the JTAG feature is not being used, this pin can be disconnected or connected to V <sub>DD</sub> . This pin is not available on TQFP packages. |
| TMS   | JTAG serial<br>input<br>synchronous  | Serial data-in to the JTAG circuit. Sampled on the rising edge of TCK. If the JTAG feature is not being used, this pin can be disconnected or connected to V <sub>DD</sub> . This pin is not available on TQFP packages. |
| ТСК   | JTAG-<br>clock                       | <b>Clock input to the JTAG circuitry</b> . If the JTAG feature is not being used, this pin must be connected to V <sub>SS</sub> . This pin is not available on TQFP packages.  |
| NC  | -                                    | No connects. Not internally connected to the die   |
| NC (18, 36,<br>72, 144,<br>288, 576,<br>1G) | -                                    | <b>These pins are not connected</b> . They will be used for expansion to the 18M, 36M, 72M, 144M 288M, 576M, and 1G densities.   |

### **Functional Overview**

All synchronous inputs pass through input registers controlled by the rising edge of the clock. All data outputs pass through output registers controlled by the rising edge of the clock. Maximum access delay from the clock rise ( $t_{CO}$ ) is 3.0 ns (200 MHz device).

The CY7C1360C/CY7C1362C supports secondary cache in systems using either a linear or interleaved burst sequence. The interleaved burst order supports Pentium and i486<sup>™</sup> processors. The linear burst sequence is suited for processors that use a linear burst sequence. The burst order is user selectable, and is determined by sampling the MODE input. Accesses can be initiated with either the processor address strobe (ADSP) or the controller address strobe (ADSC). Address advancement through the burst sequence is controlled by the ADV input. A two-bit on-chip wraparound burst counter captures the first address in a burst sequence and automatically increments the address for the rest of the burst access.

Byte write operations are qualified with the byte write enable  $(\overline{BWE})$  and byte write select  $(\overline{BW}_X)$  inputs. A global write enable  $(\overline{GW})$  overrides all byte write inputs and writes data to all four bytes. All writes are simplified with on-chip synchronous self-timed write circuitry.

Three synchronous chip selects ( $\overline{CE}_1$ ,  $CE_2$ ,  $\overline{CE}_3$ <sup>[3]</sup>) and an asynchronous output enable (OE) provide for easy bank selection and output tristate control. ADSP is ignored if  $CE_1$  is HIGH.

#### Single Read Accesses

This access is initiated when the following conditions are satisfied at clock rise: (1) ADSP or ADSC is asserted LOW,

(2)  $\overline{CE_1, CE_2, CE_3}^{[3]}$  are all asserted active, and (3) the write signals (GW, BWE) are all deasserted HIGH. ADSP is ignored if  $\overline{CE_1}$  is HIGH. The address presented to the address inputs (A) is stored into the address advancement logic and the address register while being presented to the memory array. The corresponding data is allowed to propagate to the input of the

output registers. At the rising edge of the next clock, the data is allowed to propagate through the output register and on the data bus within 3.0 ns (200 MHz device) if OE is active LOW. The only exception occurs when the SRAM is emerging from a deselected state to a selected state, its outputs are always tristated during the first cycle of the access. Afte<u>r</u> the first cycle of the access, the outputs are controlled by the OE signal. Consecutive single read cycles are supported. After the <u>SRAM</u> is <u>deselected</u> at clock rise by the chip select and either ADSP or ADSC signals, its output tristates immediately.

#### Single Write Accesses Initiated by ADSP

This access is initiated wh<u>en both</u> of the following conditions are satisfied at clock rise: (1) ADSP is asserted LOW and (2) CE<sub>1</sub>, CE<sub>2</sub>,  $\overline{CE_3}^{[3]}$  are all asserted active. The address presented to A is loaded into the address register and the address advancement logic while being delivered to the memory array. The write signals (GW, BWE, and  $\overline{BW}_X$ ) and  $\overline{ADV}$  inputs are ignored during this first cycle.

ADSP-triggered write accesses require two clock cycles to complete. If GW is asserted LOW on the second clock rise, the data presented to the DQs inputs is written into the corresponding address location in the memory <u>array</u>. If <u>GW</u> is HIGH, then the write operation is controlled by <u>BWE</u> and <u>BW<sub>X</sub></u> signals. The CY7C1360C/CY7C1362C provides byte write capability that is described in the Write <u>Cycle</u> Descriptions table. Asserting the byte write enable input (BWE) with the selected byte write (BW<sub>X</sub>) input, will selectively write to only the desired bytes. Bytes not selected during a byte write operation remain unaltered. A synchronous self-timed write mechanism has been provided to simplify the write operations.

Because the CY7C13 $\underline{60C}$ /CY7C1362C is a common I/O device, the output enable ( $\overline{OE}$ ) must be deasserted HIGH before presenting data to the DQs inputs. Doing so tristates the output drivers. As a safety precaution, DQs are automatically tristated whenever a Write cycle is detected, regardless of the state of OE.

Note\_\_\_

3.  $\overline{\text{CE}}_3$  is for A version of TQFP (3 Chip Enable option) and 165-ball FBGA package only. 119-ball BGA is offered only in 2 Chip Enable.

#### Single Write Accesses Initiated by ADSC

ADSC write accesses are initiated when the following conditions are satisfied: (1) ADSC is asserted LOW, (2) ADSP is deasserted HIGH, (3)  $CE_1$ ,  $CE_2$ ,  $CE_3^{[4]}$  are all asserted active, and (4) the appropriate combination of the write inputs (GW, BWE, and BW<sub>X</sub>) are asserted active to conduct a write to the desired byte(s). ADSC-triggered write accesses require a single clock cycle to complete. The address presented to A is loaded into the address register and the address advancement logic while being delivered to the memory array. The ADV input is ignored during this cycle. If a global write is conducted, the data presented to the DQs is written into the corresponding address location in the memory core. If a byte write is conducted, only the selected bytes are written. Bytes not selected during a byte write operation remains unaltered. A synchronous self-timed write mechanism has been provided to simplify the write operations.

Because the CY7C1360C/CY7C1362C is a common I/O device, the output enable ( $\overline{OE}$ ) must be deasserted HIGH before presenting data to the DQs inputs. Doing so tristates the output drivers. As a safety precaution, DQs are automatically tristated whenever a write cycle is detected, regardless of the state of  $\overline{OE}$ .

#### **Burst Sequences**

The CY7C1360C/CY7C1362C provides a two-bit wraparound counter, fed by A1:A0, that implements either an interleaved or linear burst sequence. The interleaved burst sequence is designed specifically to support Intel Pentium applications. The linear burst sequence is designed to support processors that follow a linear burst sequence. The burst sequence is user selectable through the MODE input.

Asserting ADV LOW at clock rise automatically increments the burst counter to the next address in the burst sequence. Both read and write burst operations are supported.

#### Sleep Mode

The ZZ input pin is an asynchronous input. Asserting ZZ places the SRAM in a power conservation 'sleep' mode. Two clock cycles are required to enter into or exit from this 'sleep' mode. While in this mode, data integrity is guaranteed. Accesses pending when entering the 'sleep' mode are not considered valid nor is the completion of the operation guaranteed. The device <u>must be deselected prior to entering the 'sleep' mode. CE<sub>1</sub>, CE<sub>2</sub>, CE<sub>3</sub><sup>[4]</sup>, ADSP, and ADSC must remain inactive for the duration of t<sub>ZZBEC</sub> after the ZZ input returns LOW.</u>

#### Interleaved Burst Address Table

(MODE = Floating or  $V_{DD}$ )

| First<br>Address<br>A1:A0 | Second<br>Address<br>A1:A0 | Third<br>Address<br>A1:A0 | Fourth<br>Address<br>A1:A0 |
|---------------------------|----------------------------|---------------------------|----------------------------|
| 00                        | 01                         | 10                        | 11                         |
| 01                        | 00                         | 11                        | 10                         |
| 10                        | 11                         | 00                        | 01                         |
| 11                        | 10                         | 01                        | 00                         |

#### Linear Burst Address Table

(MODE = GND)

| First<br>Address<br>A1:A0 | Second<br>Address<br>A1:A0 | Third<br>Address<br>A1:A0 | Fourth<br>Address<br>A1:A0 |
|---------------------------|----------------------------|---------------------------|----------------------------|
| 00                        | 01                         | 10                        | 11                         |
| 01                        | 10                         | 11                        | 00                         |

Notes

- Notes
  5. <u>X = "Don't Care." H = Logic HIGH, L = Logic LOW.</u>
  6. WRITE = L when any one or more byte write enable signals and <u>BWE</u> = L or <u>GW</u> = L. WRITE = H when all byte write enable signals, <u>BWE</u>, <u>GW</u> = H.
  7. The DQ pins are controlled by the current cycle and the <u>OE</u> signal. <u>OE</u> is asynchronous and is not sampled with the clock.
  8. <u>CE<sub>1</sub>, CE<sub>2</sub>, and CE<sub>3</sub> are available only in the TQFP package. BGA package has only two <u>chip selects CE<sub>1</sub> and CE<sub>2</sub>.</u>
  9. <u>The S</u>RAM always initiates a read cycle when ADSP is asserted, regardless of the state of <u>GW</u>, <u>BWE</u>, or <u>BW<sub>X</sub></u>. Writes may occur only on subsequent clocks after the ADSP or with the assertion of ADSC. As a result, <u>OE</u> must be driven HIGH prior to the start of the Write cycle to allow the outputs to tri-state. <u>OE</u> is a don't care for the write cycle.
  </u> the remainder of the write cycle.
- 10.  $\overline{OE}$  is asynchronous and is not sampled with the clock rise. It is masked internally during write cycles. During a read cycle all data bits are tri-State when  $\overline{OE}$  is inactive or when the device is deselected, and all data bits behave as output when  $\overline{OE}$  is active (LOW).

### Partial Truth Table for Read/Write

The Partial Truth Table for Read/Write for CY7C1360C follows. [11, 12]

| Function (CY7C1360C)                                     | GW | BWE | BWD | BW <sub>C</sub> | BWB | BWA |
|--|----|-----|-----|-----------------|-----|-----|
| Read   | Н  | Н   | Х   | Х               | Х   | Х   |
| Read   | Н  | L   | Н   | Н               | Н   | Н   |
| Write byte A $-$ (DQ <sub>A</sub> and DQP <sub>A</sub> ) | Н  | L   | Н   | Н               | Н   | L   |
| Write byte B – (DQ <sub>B</sub> and DQP <sub>B</sub> )   | Н  | L   | Н   | Н               | L   | Н   |
| Write bytes B, A   | Н  | L   | Н   | Н               | L   | L   |
| Write byte C – (DQ <sub>C</sub> and DQP <sub>C</sub> )   | Н  | L   | Н   | L               | Н   | Н   |

| Write all bytes  | L  | Х   | Х   | Х               | Х   | Х   |

## Partial Truth Table for Read/Write

The Partial Truth Table for Read/Write for CY7C1362C follows. [11, 12]

| Function (CY7C1362C)                                     | GW | BWE | BWB | BWA |
|--|----|-----|-----|-----|
| Read   | Н  | Н   | Х   | Х   |
| Read   | Н  | L   | Н   | Н   |
| Write byte A $-$ (DQ <sub>A</sub> and DQP <sub>A</sub> ) | Н  | L   | Н   | L   |
| Write byte B – (DQ <sub>B</sub> and DQP <sub>B</sub> )   | Н  | L   | L   | Н   |
| Write bytes B, A   | Н  | L   | L   | L   |
| Write all bytes  | Н  | L   | L   | L   |
| Write all bytes  | L  | Х   | Х   | Х   |

Notes

11. The DQ pins are controlled by the current cycle and the  $\overline{OE}$  signal.  $\overline{OE}$  is asynchronous and is not sampled with the clock. 12. Table only lists a partial listing of the byte write combinations. Any combination of  $\overline{BW}_X$  is valid. Appropriate write will be done based on which byte write is active.

### IEEE 1149.1 Serial Boundary Scan (JTAG)

The CY7C1360C incorporates a serial boundary scan test access port (TAP) in the BGA package only. The TQFP package does not offer this functionality. This part operates in accordance with IEEE Standard 1149.1-1900, but does not have the set of functions required for full 1149.1 compliance. These functions from the IEEE specification are excluded because their inclusion places an added delay in the critical speed path of the SRAM. Note that the TAP controller functions in a manner that does not conflict with the operation of other devices using 1149.1 fully compliant TAPs. The TAP operates using JEDEC-standard 3.3 V or 2.5 V I/O logic levels.

The CY7C1360C contains a TAP controller, instruction register, boundary scan register, bypass register, and ID register.

#### Disabling the JTAG Feature

It is possible to operate the SRAM without using the JTAG feature. To disable the TAP controller, TCK must be tied LOW (V<sub>SS</sub>) to prevent clocking of the device. TDI and TMS are internally pulled up and may be unconnected. They may alternately be connected to V<sub>DD</sub> through a pull-up resistor. TDO should be left unconnected. Upon power-up, the device comes up in a reset state which does not interfere with the operation of the device.

#### **Test Access Port (TAP)**

#### Test Clock (TCK)

The test clock is used only with the TAP controller. All inputs are captured on the rising edge of TCK. All outputs are driven from the falling edge of TCK.

#### Test Mode Select (TMS)

The TMS input is used to give commands to the TAP controller and is sampled on the rising edge of TCK. It is allowable to leave this ball unconnected if the TAP is not used. The ball is pulled up internally, resulting in a logic HIGH level.

#### Test Data-In (TDI)

The TDI ball is used to serially input information into the registers and can be connected to the input of any of the registers. The register between TDI and TDO is chosen by the instruction that is loaded into the TAP instruction register. For information on loading the instruction register, see TAP Controller State Diagram on page 15. TDI is internally pulled up and can be unconnected if the TAP is unused in an application. TDI is connected to the most significant bit (MSB) of any register.

#### Test Data-Out (TDO)

The TDO output ball is used to serially clock data-out from the registers. The output is active depending upon the current state of the TAP state machine (see Instruction Codes on page 19). The output changes on the falling edge of TCK. TDO is connected to the least significant bit (LSB) of any register.

#### Performing a TAP Reset

A RESET is performed by forcing TMS HIGH ( $V_{DD}$ ) for five rising edges of TCK. This RESET does not affect the operation of the SRAM and may be performed while the SRAM is operating.

At power-up, the TAP is reset internally to ensure that TDO comes up in a high Z state.

#### **TAP Registers**

Registers are connected between the TDI and TDO balls and enable data to be scanned into and out of the SRAM test circuitry. Only one register can be selected at a time through the instruction register. Data is serially loaded into the TDI ball on the rising edge of TCK. Data is output on the TDO ball on the falling edge of TCK.

#### Instruction Register

Three-bit instructions can be serially loaded into the instruction register. This register is loaded when it is placed between the TDI and TDO balls as shown in the TAP Controller Block Diagram on page 16. Upon power-up, the instruction register is loaded with the IDCODE instruction. It is also loaded with the IDCODE instruction if the controller is placed in a reset state as described in the previous section.

When the TAP controller is in the Capture-IR state, the two least significant bits are loaded with a binary "01" pattern to enable fault isolation of the board-level serial test data path.

#### **Bypass Register**

To save time when serially shifting data through registers, it is sometimes advantageous to skip certain chips. The bypass register is a single-bit register that can be placed between the TDI and TDO balls. This enables data to be shifted through the SRAM with minimal delay. The bypass register is set LOW ( $V_{SS}$ ) when the BYPASS instruction is executed.

#### Boundary Scan Register

The boundary scan register is connected to all the input and bidirectional balls on the SRAM.

The boundary scan register is loaded with the contents of the RAM I/O ring when the TAP controller is in the Capture-DR state and is then placed between the TDI and TDO balls when the controller is moved to the Shift-DR state. The EXTEST, SAMPLE/PRELOAD and SAMPLE Z instructions can be used to capture the contents of the I/O ring.

The Boundary Scan Order on page 20 and Boundary Scan Order on page 21 show the order in which the bits are connected. Each bit corresponds to one of the bumps on the SRAM package. The MSB of the register is connected to TDI and the LSB is connected to TDO.

#### Identification (ID) Register

The ID register is loaded with a vendor-specific, 32-bit code during the Capture-DR state when the IDCODE command is loaded in the instruction register. The IDCODE is hardwired into the SRAM and can be shifted out when the TAP controller is in the Shift-DR state. The ID register has a vendor code and other information described in Identification Register Definitions on page 19.

#### **TAP Instruction Set**

#### Overview

Eight different instructions are possible with the three-bit instruction register. All combinations are listed in Instruction Codes on page 19. Three of these instructions are listed as RESERVED and should not be used. The other five instructions are described in detail in this section.

The TAP controller used in this SRAM is not fully compliant to the 1149.1 convention because some of the mandatory 1149.1 instructions are not fully implemented.

The TAP controller cannot be used to load address data or control signals into the SRAM and cannot preload the I/O buffers. The SRAM does not implement the 1149.1 commands EXTEST or INTEST or the PRELOAD portion of SAMPLE/PRELOAD; rather, it performs a capture of the I/O ring when these instructions are executed.

Instructions are loaded into the TAP controller during the Shift-IR state when the instruction register is placed between TDI and TDO. During this state, instructions are shifted through the instruction register through the TDI and TDO balls. To execute the instruction once it is shifted in, the TAP controller needs to be moved into the Update-IR state.

#### EXTEST

EXTEST is a mandatory 1149.1 instruction which is to be executed whenever the instruction register is loaded with all 0s. EXTEST is not implemented in this SRAM TAP controller, and therefore this device is not compliant to 1149.1. The TAP controller does recognize an all-0 instruction.

When an EXTEST instruction is loaded into the instruction register, the SRAM responds as if a SAMPLE/PRELOAD instruction has been loaded. There is one difference between the two instructions. Unlike the SAMPLE/PRELOAD instruction, EXTEST places the SRAM outputs in a high Z state.

#### IDCODE

The IDCODE instruction causes a vendor-specific, 32-bit code to be loaded into the instruction register. It also places the instruction register between the TDI and TDO balls and allows the IDCODE to be shifted out of the device when the TAP controller enters the Shift-DR state.

The IDCODE instruction is loaded into the instruction register upon power up or whenever the TAP controller is given a test logic reset state.

#### SAMPLE Z

The SAMPLE Z instruction causes the boundary scan register to be connected between the TDI and TDO balls when the TAP

controller is in a Shift-DR state. It also places all SRAM outputs into a high Z state.

#### SAMPLE/PRELOAD

SAMPLE/PRELOAD is a 1149.1 mandatory instruction. When the SAMPLE/PRELOAD instructions are loaded into the instruction register and the TAP controller is in the Capture-DR state, a snapshot of data on the inputs and output pins is captured in the boundary scan register.

The user must be aware that the TAP controller clock can only operate at a frequency up to 20 MHz, while the SRAM clock operates more than an order of magnitude faster. Because there is a large difference in the clock frequencies, it is possible that during the Capture-DR state, an input or output will undergo a transition. The TAP may then try to capture a signal while in transition (metastable state). This will not harm the device, but there is no guarantee as to the value that will be captured. Repeatable results may not be possible.

To guarantee that the boundary scan register will capture the correct value of a signal, the SRAM signal must be stabilized long enough to meet the TAP controller's capture setup plus hold times ( $t_{CS}$  and  $t_{CH}$ ). The SRAM clock input might not be captured correctly if there is no way in a design to stop (or slow) the clock during a SAMPLE/PRELOAD instruction. If this is an issue, it is still possible to capture all other signals and simply ignore the value of the CK and CK captured in the boundary scan register.

After the data is captured, it is possible to shift out the data by putting the TAP into the Shift-DR state. This places the boundary scan register between the TDI and TDO pins.

PRELOAD enables an initial data pattern to be placed at the latched parallel outputs of the boundary scan register cells prior to the selection of another boundary scan test operation.

The shifting of data for the SAMPLE and PRELOAD phases can occur concurrently when required - that is, while data captured is shifted out, the preloaded data can be shifted in.

#### BYPASS

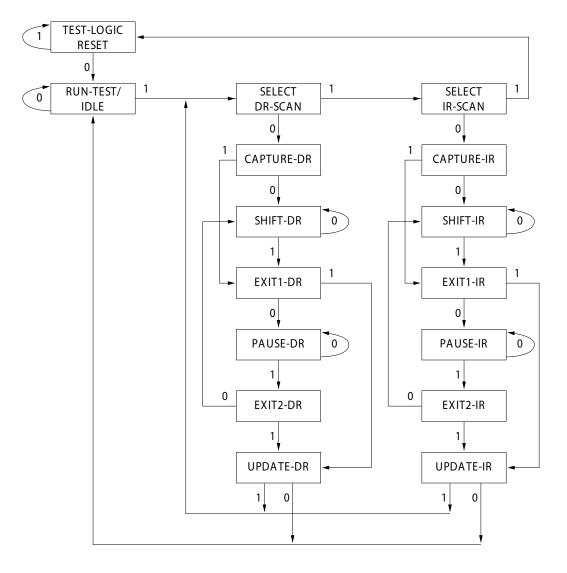

When the BYPASS instruction is loaded in the instruction register and the TAP is placed in a Shift-DR state, the bypass register is placed between the TDI and TDO balls. The advantage of the BYPASS instruction is that it shortens the boundary scan path when multiple devices are connected together on a board.

#### Reserved

These instructions are not implemented but are reserved for future use. Do not use these instructions.

### 3.3 V TAP AC Test Conditions

| Input pulse levels                   | V <sub>SS</sub> to 3.3 V |
|--------------------------------------|--------------------------|
| Input rise and fall times            | 1 ns                     |
| Input timing reference levels        | 1.5 V                    |
| Output reference levels              | 1.5 V                    |
| Test load termination supply voltage | 1.5 V                    |

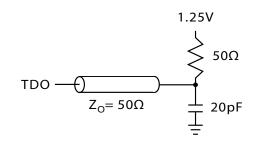

## 3.3 V TAP AC Output Load Equivalent

## 2.5 V TAP AC Test Conditions

| Input pulse levels                   | V <sub>SS</sub> to 2.5 V |
|--------------------------------------|--------------------------|
| Input rise and fall time             | 1 ns                     |
| Input timing reference levels        | 1.25 V                   |
| Output reference levels              | 1.25 V                   |
| Test load termination supply voltage | 1.25 V                   |

## 2.5 V TAP AC Output Load Equivalent

#### Notes

13. t<sub>CS</sub> and t<sub>CH</sub> refer to the setup and hold time requirements of latching data from the boundary scan register. 14. Test conditions are specified using the load in TAP AC test Conditions. t<sub>R</sub>/t<sub>F</sub> = 1 ns.

## **TAP DC Electrical Characteristics and Operating Conditions**

| Cypress device ID (17:12)            | 100110                   | Defines width and density                   |
| Cypress JEDEC ID code (11:1)         | 00000110100              | Allows unique identification of SRAM vendor |
| ID register presence indicator (0)   | 1                        | Indicates the presence of an ID register    |

### **Scan Register Sizes**

| Register Name                               | Bit Size (× 36) |
|---|-----------------|
| Instruction                                 | 3               |
| Bypass                                      | 1               |
| ID  | 32              |
| Boundary scan order (119-ball BGA package)  | 71              |
| Boundary scan order (165-ball FBGA package) | 71              |

### **Instruction Codes**

| Instruction    | Code | Description  |
|----------------|------|--|
| EXTEST         | 000  | Captures I/O ring contents. Places the boundary scan register between TDI and TDO. Forces all SRAM outputs to high Z state.                |
| IDCODE         | 001  | Loads the ID register with the vendor ID code and places the register between TDI and TDO. This operation does not affect SRAM operations. |
| SAMPLE Z       | 010  | Captures I/O ring contents. Places the boundary scan register between TDI and TDO. Forces all SRAM output drivers to a high Z state.       |
| RESERVED       | 011  | Do Not Use: This instruction is reserved for future use.   |
| SAMPLE/PRELOAD | 100  | Captures I/O ring contents. Places the boundary scan register between TDI and TDO. Does not affect SRAM operation.                         |
| RESERVED       | 101  | Do Not Use: This instruction is reserved for future use.   |
| RESERVED       | 110  | Do Not Use: This instruction is reserved for future use.   |
| BYPASS         | 111  | Places the bypass register between TDI and TDO. This operation does not affect SRAM operations.  |

Note 16. Bit #24 is "1" in the Register Definitions for both 2.5 V and 3.3 V versions of this device.

### **Maximum Ratings**

Exceeding maximum ratings may impair the useful life of the device. These user guidelines are not tested.

| Storage temperature  | –65 °C to +150 °C                |
|--|----------------------------------|
| Ambient temperature with power applied   | –55 °C to +125 °C                |
| Supply voltage on $V_{DD}$ relative to GND                                     | –0.5 V to +4.6 V                 |
| Supply voltage on $V_{DDQ}$ relative to GND                                    | 0 –0.5 V to +V <sub>DD</sub>     |
| DC voltage applied to outputs<br>in tri-state0                                 | .5 V to V <sub>DDQ</sub> + 0.5 V |
| DC input voltage   | 0.5 V to V <sub>DD</sub> + 0.5 V |
| Current into outputs (LOW)   | 20 mA                            |
| Static discharge voltage<br>(per MIL-STD-883, method 3015)<br>Latch-up current |                                  |

## **Operating Range**

| Range      | Ambient<br>Temperature | V <sub>DD</sub> | V <sub>DDQ</sub> |
|------------|------------------------|-----------------|------------------|
| Commercial | 0 °C to +70 °C         | 3.3 V – 5 % /   | 2.5 V – 5% to    |
| Industrial | –40 °C to +85 °C       | + 10%           | V <sub>DD</sub>  |

| I <sub>OZ</sub>    | Output leakage current                   | $GND \le V_I \le V_{DDQ}$ , output disabled | -5    | 5                       | μA   |

#### Notes

17. Overshoot:  $V_{IH(AC)} < V_{DD} + 1.5 V$  (Pulse width less than  $t_{CYC}/2$ ), undershoot:  $V_{IL(AC)} > -2 V$  (Pulse width less than  $t_{CYC}/2$ ). 18.  $T_{Power-up}$ : Assumes a linear ramp from 0 V to  $V_{DD(min)}$  within 200 ms. During this time  $V_{IH} < V_{DD}$  and  $V_{DDQ} \le V_{DD}$ .

| t <sub>CEH</sub>              | Chip enable hold after CLK rise                               | 0.5      | -   | 0.5  | -   | ns   |

Notes

t<sub>CHZ</sub>, t<sub>CLZ</sub>, t<sub>OELZ</sub>, and t<sub>OEHZ</sub> are specified with AC test conditions shown in part (b) of Figure 5 on page 24. Transition is measured ± 200 mV from steady-state voltage.
 At any given voltage and temperature, t<sub>OEHZ</sub> is less than t<sub>OELZ</sub> and t<sub>CHZ</sub> is less than t<sub>CLZ</sub> to eliminate bus contention between SRAMs when sharing the same data bus. These specifications do not imply a bus contention condition, but reflect parameters guaranteed over worst case user conditions. Device is designed to achieve high Z prior to low Z under the same system conditions.

25. This parameter is sampled and not 100% tested.

Document Number: 38-05540 Rev. \*U

<sup>20.</sup> Timing reference level is 1.5 V when V<sub>DDQ</sub> = 3.3 V and is 1.25 V when V<sub>DDQ</sub> = 2.5 V.
21. Test conditions shown in (a) of Figure 5 on page 24 unless otherwise noted.
22. This part has a voltage regulator internally; t<sub>POWER</sub> is the time that the power needs to be supplied above V<sub>DD(minimum)</sub> initially before a read or write operation can be initiated.

### **Switching Waveforms**

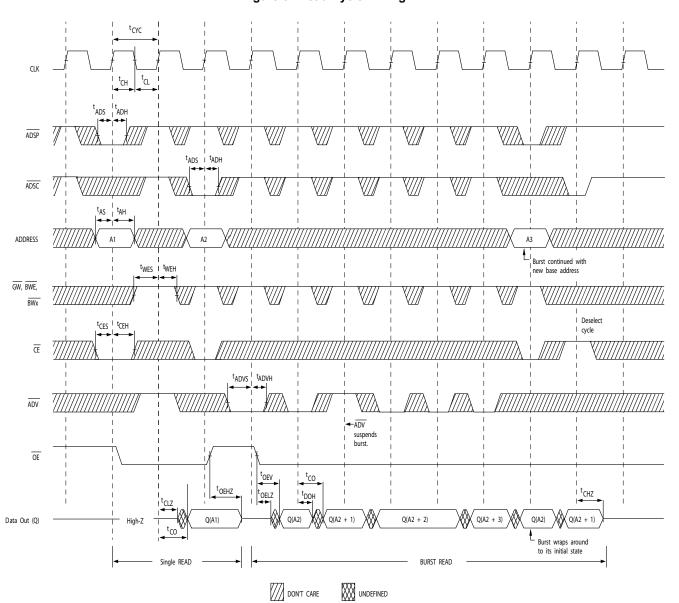

Figure 6. Read Cycle Timing <sup>[26]</sup>

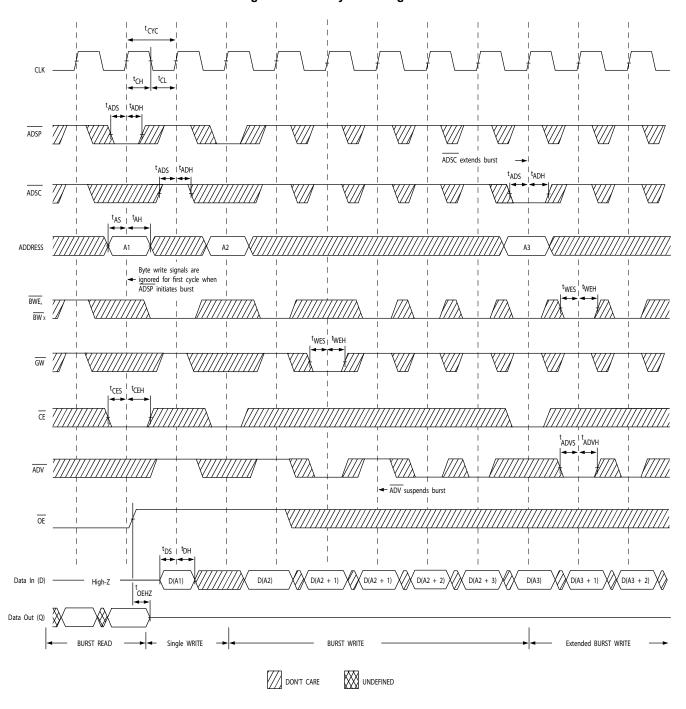

#### Note

26. On this diagram, when  $\overline{CE}$  is LOW:  $\overline{CE}_1$  is LOW,  $CE_2$  is HIGH and  $\overline{CE}_3$  is LOW. When  $\overline{CE}$  is HIGH:  $\overline{CE}_1$  is HIGH or  $CE_2$  is LOW or  $\overline{CE}_3$  is HIGH.

### Switching Waveforms (continued)

Figure 7. Write Cycle Timing <sup>[27, 28]</sup>

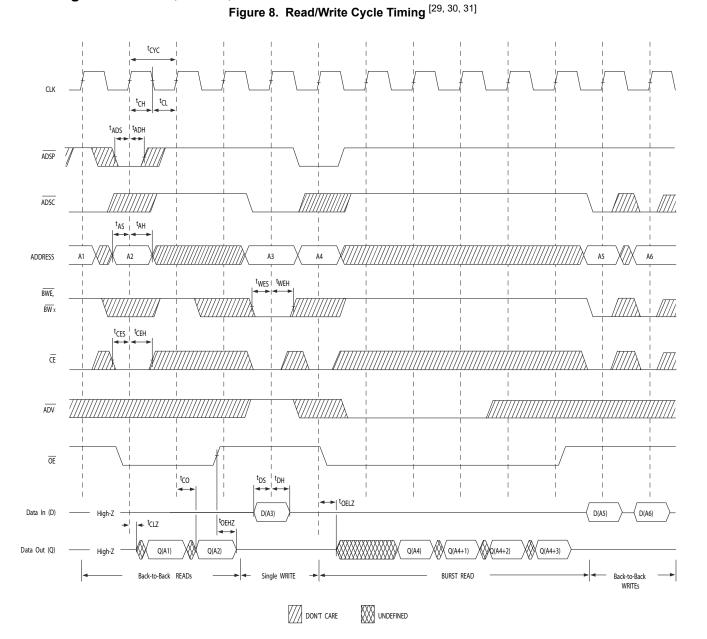

Notes

27. On this diagram, when  $\overline{CE}$  is LOW:  $\overline{CE}_1$  is LOW,  $CE_2$  is HIGH and  $\overline{CE}_3$  is LOW. When  $\overline{CE}$  is HIGH:  $\overline{CE}_1$  is HIGH or  $CE_2$  is LOW or  $\overline{CE}_3$  is HIGH. 28. Full width write can be initiated by either  $\overline{GW}$  LOW; or by  $\overline{GW}$  HIGH,  $\overline{BWE}$  LOW and  $\overline{BW}_X$  LOW.

### Switching Waveforms (continued)

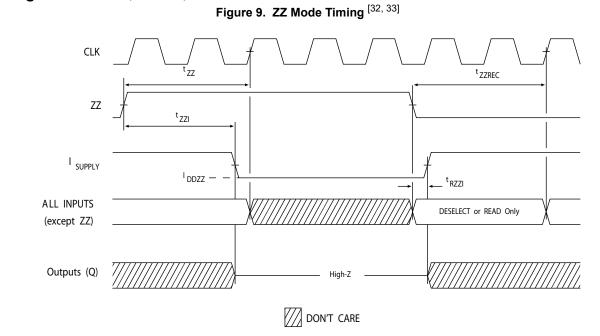

Notes

29. On this diagram, when  $\overline{CE}$  is LOW:  $\overline{CE}_1$  is LOW,  $CE_2$  is HIGH and  $\overline{CE}_3$  is LOW. When  $\overline{CE}$  is HIGH:  $\overline{CE}_1$  is HIGH or  $CE_2$  is LOW or  $\overline{CE}_3$  is HIGH. 30. The data bus (Q) remains in high Z following a write cycle, unless a new read access is initiated by  $\overline{ADSP}$  or  $\overline{ADSC}$ . 31.  $\overline{GW}$  is HIGH.

## Switching Waveforms (continued)

Notes

32. Device must be deselected when entering ZZ mode. See Cycle Descriptions table for all possible signal conditions to deselect the device. 33. DQs are in high Z when exiting ZZ sleep mode.

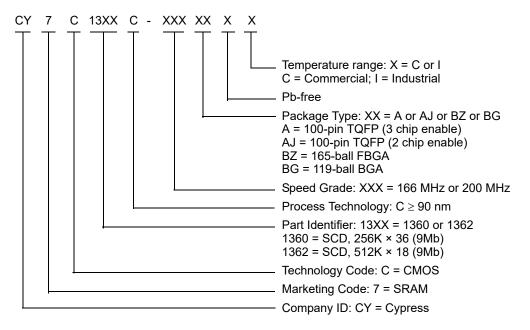

### **Ordering Information**

The table below contains only the parts that are currently available. If you don't see what you are looking for, please contact your local sales representative. For more information, visit the Cypress website at www.cypress.com and refer to the product summary page at http://www.cypress.com/products

Cypress maintains a worldwide network of offices, solution centers, manufacturer's representatives and distributors. To find the office closest to you, visit us at http://www.cypress.com/go/datasheet/offices
