

Please note that Cypress is an Infineon Technologies Company.

The document following this cover page is marked as “Cypress” document as this is the company that originally developed the product. Please note that Infineon will continue to offer the product to new and existing customers as part of the Infineon product portfolio.

Continuity of document content

The fact that Infineon offers the following product as part of the Infineon product portfolio does not lead to any changes to this document. Future revisions will occur when appropriate, and any changes will be set out on the document history page.

Continuity of ordering part numbers

Infineon continues to support existing part numbers. Please continue to use the ordering part numbers listed in the datasheet for ordering.

Features

- Temperature ranges
 - Commercial: 0 °C to +70 °C
 - Industrial: -40 °C to +85 °C
 - Automotive-A: -40 °C to +85 °C
 - Automotive-E: -40 °C to +125 °C
- High speed: 55 ns
- Voltage range: 4.5 V to 5.5 V operation
- Low active power
 - 275 mW (max)
- Low standby power (LL version)
 - 82.5 μW (max)
- Easy memory expansion with \overline{CE} and \overline{OE} Features
- TTL-compatible inputs and outputs
- Automatic power-down when deselected
- CMOS for optimum speed and power
- Available in Pb-free and non Pb-free 28-pin (600-mil) PDIP, 28-pin (300-mil) narrow SOIC, 28-pin TSOP I, and 28-pin reverse TSOP I packages

Functional Description

The CY62256N is a high performance CMOS static RAM organized as 32K words by 8 bits. Easy memory expansion is provided by an active LOW chip enable (\overline{CE}) and active LOW output enable (\overline{OE}) and tristate drivers. This device has an automatic power-down feature, reducing the power consumption by 99.9 percent when deselected.

An active LOW write enable signal (\overline{WE}) controls the writing/reading operation of the memory. When \overline{CE} and \overline{WE} inputs are both LOW, data on the eight data input/output pins (I/O_0 through I/O_7) is written into the memory location addressed by the address present on the address pins (A_0 through A_{14}). Reading the device is accomplished by selecting the device and enabling the outputs, \overline{CE} and \overline{OE} active LOW, while \overline{WE} remains inactive or HIGH. Under these conditions, the contents of the location addressed by the information on address pins are present on the eight data input/output pins.

The input/output pins remain in a high impedance state unless the chip is selected, outputs are enabled, and write enable (\overline{WE}) is HIGH.

Pin Configurations

Figure 1. 28-pin DIP and Narrow SOIC pinout

Figure 2. 28-pin TSOP I and Reverse TSOP I pinout

Pin Definitions

Pin Number	Type	Description
1–10, 21, 23–26	Input	A₀–A₁₄ . Address Inputs
11–13, 15–19,	Input/Output	I/O₀–I/O₇ . Data lines. Used as input or output lines depending on operation
27	Input/Control	WE . When selected LOW, a WRITE is conducted. When selected HIGH, a READ is conducted
20	Input/Control	CE . When LOW, selects the chip. When HIGH, deselects the chip
22	Input/Control	OE . Output Enable. Controls the direction of the I/O pins. When LOW, the I/O pins behave as outputs. When deasserted HIGH, I/O pins are tristated, and act as input data pins
14	Ground	GND . Ground for the device
28	Power Supply	V_{CC} . Power supply for the device

Note

1. Typical specifications are the mean values measured over a large sample size across normal production process variations and are taken at nominal conditions (T_A = 25 °C, V_{CC}). Parameters are guaranteed by design and characterization, and not 100% tested.

Maximum Ratings

Exceeding maximum ratings may impair the useful life of the device. These user guidelines are not tested.

Storage temperature -65 °C to +150 °C

Ambient temperature with power applied -55 °C to +125 °C

Supply voltage to ground potential (pin 28 to pin 14) [2] -0.5 V to +7.0 V

DC voltage applied to outputs in high Z State [2] -0.5 V to $V_{CC} + 0.5$ V

DC input voltage [2] -0.5 V to $V_{CC} + 0.5$ V

Output current into outputs (LOW) 20 mA

Static discharge voltage (per MIL-STD-883, method 3015) > 2001 V

Latch-up current > 200 mA

Operating Range

Range	Ambient Temperature (T_A) [3]	V_{CC}
Commercial	0 °C to +70 °C	5 V \pm 10%
Industrial	-40 °C to +85 °C	5 V \pm 10%
Automotive-A	-40 °C to +85 °C	5 V \pm 10%
Automotive-E	-40 °C to +125 °C	5 V \pm 10%

Electrical Characteristics

Over the Operating Range

Parameter	Description	Test Conditions	-55			-70			Unit	
			Min	Typ [4]	Max	Min	Typ [4]	Max

			LL - Automotive-A	-	0.1	10	-	0.1	10	μ A
			LL - Automotive-E	-	0.1	15	-	-	-	μ A

Notes

- V_{IL} (min) = -2.0 V for pulse durations of less than 20 ns.
- T_A is the "Instant-On" case temperature.
- Typical specifications are the mean values measured over a large sample size across normal production process variations and are taken at nominal conditions ($T_A = 25$ °C, V_{CC}). Parameters are guaranteed by design and characterization, and not 100% tested.

Capacitance

Parameter ^[5]	Description	Test Conditions	Max	Unit
C_{IN}	Input capacitance	$T_A = 25\text{ }^\circ\text{C}$, $f = 1\text{ MHz}$, $V_{CC} = 5.0\text{ V}$	6	pF
C_{OUT}	Output capacitance		8	pF

Thermal Resistance

Parameter ^[5]	Description	Test Conditions	DIP	SOIC	TSOP	RTSOP	Unit
θ_{JA}	Thermal resistance (junction to ambient)	Still air, soldered on a 4.25×1.125 inch, 4-layer printed circuit board	75.61	76.56	93.89	93.89	$^\circ\text{C/W}$
θ_{JC}	Thermal resistance (junction to case)		43.12	36.07	24.64	24.64	$^\circ\text{C/W}$

t_{SA}	Address setup to write start	0	–	0	–	ns
t_{PWE}	\overline{WE} pulse width	40	–	50	–	ns
t_{SD}	Data setup to write end	25	–	30	–	ns
t_{HD}	Data hold from write end	0	–	0	–	ns
t_{HZWE}	\overline{WE} LOW to high Z ^[9, 10]	–	20	–	25	ns
t_{LZWE}	\overline{WE} HIGH to low Z ^[9]	5	–	5	–	ns

Notes

8. Test conditions assume signal transition time of 5 ns or less, timing reference levels of 1.5 V, input pulse levels of 0 to 3.0 V, and output loading of the specified I_{OL}/I_{OH} and 100-pF load capacitance.
9. At any temperature and voltage condition, t_{HZCE} is less than t_{LZCE} , t_{HZOE} is less than t_{LZOE} , and t_{HZWE} is less than t_{LZWE} for any device.
10. t_{HZOE} , t_{HZCE} , and t_{HZWE} are specified with $C_L = 5$ pF as in (b) of AC Test Loads. Transition is measured ± 500 mV from steady-state voltage.
11. The internal Write time of the memory is defined by the overlap of \overline{CE} LOW and \overline{WE} LOW. Both signals must be LOW to initiate a Write and either signal can terminate a Write by going HIGH. The data input setup and hold timing should be referenced to the rising edge of the signal that terminates the Write.
12. The minimum write cycle time for Write Cycle No. 3 (\overline{WE} Controlled, \overline{OE} LOW) is the sum of t_{HZWE} and t_{SD} .

Switching Waveforms

Figure 5. Read Cycle No. 1 [13, 14]

Figure 6. Read Cycle No. 2 [14, 15]

Notes

13. Device is continuously selected. $\overline{OE}, \overline{CE} = V_{IL}$.
14. \overline{WE} is HIGH for Read cycle.
15. Address valid prior to or coincident with \overline{CE} transition LOW.

Switching Waveforms (continued)

Figure 7. Write Cycle No. 1 (\overline{WE} Controlled) [16, 17, 18]

Figure 8. Write Cycle No. 2 (\overline{CE} Controlled) [16, 17, 18]

Figure 9. Write Cycle No. 3 (\overline{WE} Controlled, \overline{OE} LOW) [18, 20]

Notes

16. The internal Write time of the memory is defined by the overlap of \overline{CE} LOW and \overline{WE} LOW. Both signals must be LOW to initiate a Write and either signal can terminate a Write by going HIGH. The data input setup and hold timing should be referenced to the rising edge of the signal that terminates the Write.
17. Data I/O is high impedance if $OE = V_{IH}$.
18. If \overline{CE} goes HIGH simultaneously with \overline{WE} HIGH, the output remains in a high-impedance state.
19. During this period, the I/Os are in output state and input signals should not be applied.
20. The minimum write cycle pulse width should be equal to the sum of t_{SD} and t_{HZWE} .
