## Functional Description

The CY7C1019D <sup>[1]</sup> is a high-performance CMOS static RAM organized as 131,072 words by 8 bits. Easy memory expansion is provided by an active LOW Chip Enable ( $\overline{CE}$ ), an active LOW Output Enable ( $\overline{OE}$ ), and tri-state drivers. This device has an automatic power-down feature that significantly reduces power consumption when deselected. The eight input and output pins (IO<sub>0</sub> through IO<sub>7</sub>) are placed in a high-impedance state when:

- Deselected ( $\overline{CE}$  HIGH)
- Outputs are disabled ( $\overline{OE}$  HIGH)
- When the write operation is active ( $\overline{CE}$  LOW, and  $\overline{WE}$  LOW).

Write to the device by taking Chip Enable ( $\overline{CE}$ ) and Write Enable ( $\overline{WE}$ ) inputs LOW. Data on the eight IO pins (IO<sub>0</sub> through IO<sub>7</sub>) is then written into the location specified on the address pins (A<sub>0</sub> through A<sub>16</sub>).

Read from the device by taking Chip Enable ( $\overline{CE}$ ) and Output Enable ( $\overline{OE}$ ) LOW while forcing Write Enable ( $\overline{WE}$ ) HIGH. Under these conditions, the contents of the memory location specified by the address pins appears on the IO pins.

The CY7C1019D device is suitable for interfacing with processors that have TTL I/P levels. It is not suitable for processors that require CMOS I/P levels. Please see [Electrical Characteristics on page 4](#) for more details and suggested alternatives.

### Notes

8. Test conditions assume signal transition time of 3 ns or less, timing reference levels of 1.5 V, input pulse levels of 0 to 3.0 V, and output loading of the specified  $I_{\text{OL}}/I_{\text{OH}}$  and 30-pF load capacitance.
9.  $t_{\text{POWER}}$  gives the minimum amount of time that the power supply should be at typical  $V_{\text{CC}}$  values until the first memory access can be performed.
10.  $t_{\text{HZOE}}$ ,  $t_{\text{HZCE}}$ , and  $t_{\text{HZWE}}$  are specified with a load capacitance of 5 pF as in (c) of [Figure 2 on page 5](#). Transition is measured when the outputs enter a high impedance state.
11. At any given temperature and voltage condition,  $t_{\text{HZCE}}$  is less than  $t_{\text{LZCE}}$ ,  $t_{\text{HZOE}}$  is less than  $t_{\text{LZOE}}$ , and  $t_{\text{HZWE}}$  is less than  $t_{\text{LZWE}}$  for any given device.
12. This parameter is guaranteed by design and is not tested.
13. The internal write time of the memory is defined by the overlap of  $\overline{\text{CE}}$  LOW and  $\overline{\text{WE}}$  LOW.  $\overline{\text{CE}}$  and  $\overline{\text{WE}}$  must be LOW to initiate a write, and the transition of any of these signals can terminate the write. The input data set-up and hold timing should be referenced to the leading edge of the signal that terminates the write.
14. The minimum write cycle time for Write Cycle no. 3 ( $\overline{\text{WE}}$  controlled,  $\overline{\text{OE}}$  LOW) is the sum of  $t_{\text{HZWE}}$  and  $t_{\text{SD}}$ .

**Notes**

- 15. Device is continuously selected.  $\overline{OE}$ ,  $\overline{CE}$  =  $V_{IL}$ .

Notes

- 18. Data IO is high impedance if  $\overline{OE} = V_{IH}$ .
- 19. If CE goes HIGH simultaneously with WE going HIGH, the output remains in a high-impedance state.
- 20. During this period the IOs are in the output state and input signals should not be applied.

Switching Waveforms (continued)

Figure 8. Write Cycle No. 3 ( $\overline{WE}$  Controlled,  $\overline{OE}$  LOW) [21, 22]

Notes

21. The minimum write cycle time for Write Cycle no. 3 ( $\overline{WE}$  controlled,  $\overline{OE}$  LOW) is the sum of  $t_{HZWE}$  and  $t_{SD}$ .

22. If  $\overline{CE}$  goes HIGH simultaneously with  $\overline{WE}$  going HIGH, the output remains in a high-impedance state.

23. During this period the IOs are in the output state and input signals should not be applied.
