

## ST40 Micro Toolset for developing ST40 applications

Data brief

### Features

- GNU code development tools
  - ANSI C and C++ compiler for ST40
  - C (**newlib**) run-time library and C++ (**libstdc++**) including STL
  - GNU archiver and other utilities
  - Board specs defining memory area for linker
  - Boot from Flash ROM support
  - Extensive set of trace and profiling tools
- Cross development with GDB
  - The GNU debugger supports the ST40 simulator and development boards
  - Includes Text User Interface (TUI) and the Insight GUI on all host platforms
  - **sh4xrun** target loader
- OS21 real-time kernel, provides:
  - High-performance, low-memory footprint
  - Tasks, semaphores, message queues
  - Memory management and virtual memory API
  - Mutexes and events
  - Interrupt handling, cache control and timers
  - Sources supplied, royalty free
- Instruction set simulator
  - Programs can be run without hardware
  - Low-level execution tracing
- Interface to the target through ST Micro Connect and ST TargetPack technology (supplied separately)
- STWorkbench IDE (supplied separately)
  - Built on the Eclipse IDE
  - State-of-the-art IDE for use with a range of ST toolsets
  - Powerful editing tools and ST40 specific plug-ins customize the IDE for building and debugging ST40 target applications
  - Advanced trace and profiling tools

### Description

The ST40 Micro Toolset supports application development for ST40-based systems.

Applications can be efficiently implemented in ANSI C or ANSI C++ and mapped to the target hardware.

In conjunction with the on-chip emulation support of the ST40, the ST40 Micro Toolset supports board level debugging through the JTAG interface. The tools can be used through the STWorkbench Integrated Development Environment (IDE).

The toolset supports host-target interconnection through the ST Micro Connect 2<sup>(a)</sup>, using either Ethernet or USB connections or ST Micro Connect Lite, using a USB connection only.

a. The original ST Micro Connect product was named the "ST Micro Connect". This product is now known as the "ST Micro Connect 1" and the term "ST Micro Connect" refers to the family of ST Micro Connect devices.

# 1 Introduction

The ST40 Micro Toolset is a cross-development system for developing and debugging C and C++ embedded applications on ST40 board devices. All ST40-based devices include the User Debug Interface (UDI), available through the JTAG port of the device, which provides on-chip emulation capabilities such as:

- code and data breakpoints
- watchpoints
- memory peeking and poking

The ST40 Micro Toolset can be enhanced by the STWorkbench IDE (supplied separately). STWorkbench is built on the Eclipse IDE, providing a state-of-the-art IDE for a wide range of toolsets provided by STMicroelectronics. ST40 specific plug-ins customize STWorkbench to support the full development cycle of ST40 target applications, including:

- program editing
- project workspace management
- program building
- program debugging
- advanced trace and profiling tools

See the *STWorkbench data brief* (8063672) for more information.

## 1.1 Toolset features

The ST40 Micro Toolset provides an integrated set of tools to support the development of embedded applications.

- Code development tools (assembler, linker and compiler)  
Program development is supported by the GCC compatible C/C++ optimizing compilers, assembler, linker and archiver (librarian) tools. Assembler code can be inserted in-line in C/C++ programs. The compiler and linker support mapping of application code and data objects to target memory.
- A C/C++ run-time system  
The **newlib** C library provides ANSI C/C++ run-time functions including support for C I/O using the facilities of the host system. The C++ run-time system is provided by the GNU GCC **libstdc++** library which includes support for the STL and **iostream** ISO C++ standard libraries.
- Cross development with GDB  
The GNU debugger (GDB) supports both the ST40 simulator and the hardware development boards. GDB also includes a text-user interface and the Insight GUI as a graphical user interface on all supported host platforms. The **sh4xrun** tool is also available to provide a command-line driven interface to simplify downloading and running applications on the ST40-based targets.
- OS21 real-time kernel  
The OS21 real-time kernel supports the design of embedded systems. OS21 facilitates the decomposition of a design into a collection of communicating tasks and interrupt handlers.

- Trace and statistical data analysis tools  
The toolset supports tracing of OS21 kernel activity and OS21 API function calls. The user may control OS21 trace either by using GDB commands or function calls embedded in the application. Trace and other statistical information can be viewed graphically in STWorkbench.
- Profiler support  
Performance data can be obtained when running an application on an ST40 simulator and used to generate statistical and trace information. Performance data can also be acquired from an application running on a target board connected to an ST Micro Connect. The data can be analyzed using STWorkbench.
- The ST40 simulator  
This provides an accurate software simulation of SuperH architecture cores (such as the ST40) and comes in two forms:
  - Functional simulator, which simulates the core accurately, but ignores details such as pipelines
  - Performance simulator, which simulates the core in detail in order to model the performance
- Flash ROM examples  
Several Flash ROM examples are provided. These create applications that are able to boot from ROM on an ST40-based target.
- Host-target interface support  
The ST40 Micro Toolset supports host-target connection using the ST Micro Connect 2<sup>(a)</sup> or ST Micro Connect Lite.  
The ST Micro Connect 2 supports:
  - Ethernet and USB connection of a target system to a PC (running Microsoft Windows or Linux).
  - Connection to a target development board's JTAG connector, enabling the host software to start up the target, download programs and debug them in the target.
  - Use of ST TargetPacks to configure a target and bring up target hardware. (ST TargetPacks for current evaluation boards containing ST40 parts are supplied with the ST Micro Connection Package, or are available separately from STMicroelectronics.)

For more information, see the *ST Micro Connect 2 data brief* (8161370).

The ST Micro Connect Lite is a low-cost alternative to the ST Micro Connect 2 that supports only a USB connection of a target system to a PC.

For more information, see the *ST Micro Connect Lite data brief* (8298299).

---

a. The ST Micro Connect 1 is still supported but can no longer be ordered.

## 1.2 OS21 real-time operating system features

OS21 is a real-time operating system, available for a range of cores including the ST40. It provides an embedded application with the features listed below.

- OS21 is multitasking. The OS21 kernel performs real-time scheduling of all the tasks in the system, based upon the relative priority of each task. This means that an embedded system can be designed as a collection of communicating tasks and interrupt handlers.
- Memory blocks can be allocated and freed from memory partitions for dynamic memory management. OS21 supports three pre-defined types of memory partition (**heap**, **fixed**, and **simple**) in order to use limited memory resources efficiently. User-defined memory partitions are also permitted. The standard C library functions (such as `malloc()`) are available.
- Inter-task communication is undertaken by means of message queues. Tasks can send and receive messages through a simple API.
- Semaphores, mutexes and event flags provide mechanisms for mutual exclusion and access control to a shared resource.
- OS21 provides several clock functions to read the current time; to pause the execution of a task until a specified time; and to time-out an input communication. OS21 uses a 64-bit signed integer to record time as a given number of clock ticks. Time calculations can be carried out using simple arithmetic.
- The interrupt API provides a mechanism for external events (such as peripherals) to communicate directly with the CPU. Whenever an interrupt is asserted, the CPU stops executing the current task and executes the interrupt handler for that interrupt. When the interrupt handler has completed, the CPU resumes execution of the interrupted task.
- The exception API processes unexpected events that occur during the execution of an instruction by passing control to an exception handler. If the exception is fatal, the exception handler outputs an informative message before terminating the process. For non-fatal exceptions, the exception handler may perform remedial actions before passing control back to the task that was running when the exception occurred. It is also possible to add user-defined exception handlers.
- The callback API enables user-supplied hook routines to be called whenever a given OS21 event occurs.
- OS21 can access devices and memory over a bus using virtual addresses that map to physical addresses in the device or memory.
- OS21 provides a comprehensive set of functions for handling the CPU's instruction and data caches. If a level 2 cache is available, OS21 can (optionally) drive it. OS21 maintains the state of the level 2 cache from within the cache management API.
- OS21 provides a support framework for power management. Several different power levels are defined, together with a mechanism for switching between levels. There is a mechanism for operations such as RAM power management and wake-up interrupt validation.
- Board Support Packages (BSPs) are available for all supported platforms, both as pre-built binaries and as source files. The BSPs declare board-specific data (such as a description of the interrupt system for the board) and configuration options, and thereby allow OS21 to be customized for any valid board, chip and CPU combination.

OS21 is distributed in the form of source code, ready to be compiled for the target SoC.

### 1.2.1 OSPlus

OSPlus (available separately) is an enhancement package for OS21 that provides a number of additional APIs for enabling device drivers (such as modems, printers, and removable storage, for example) and I/O infrastructure (including FAT and Ext2 file systems).

OSPlus extensions are available to provide such additional features as a TCP/IP stack and a USB stack. The extension packages require the OSPlus base package to be installed as a prerequisite.

See *OSPlus data brief* (7813502) for more information.

## 2 Toolset overview

This chapter describes the contents of the ST40 Micro Toolset.

### 2.1 Software tools

The ST40 software tools include:

#### From the GNU binutils package

<b>sh4as</b>	GNU assembler
<b>sh4ld</b>	GNU linker
<b>sh4addr2line</b>	Convert addresses into file names and line numbers
<b>sh4ar</b>	Create, modify, and extract from archives
<b>sh4elfedit</b>	Edit the header of ELF format files
<b>sh4c++filt</b>	Demangle encoded C++ symbols
<b>sh4gprof</b>	GNU profiler
<b>sh4nm</b>	List symbols from object files
<b>sh4objcopy</b>	Copy and translate object files
<b>sh4objdump</b>	Display information from object files
<b>sh4ranlib</b>	Generate index to archive contents
<b>sh4readelf</b>	Display contents of ELF files
<b>sh4size</b>	List file section sizes and total size
<b>sh4strings</b>	List printable strings from files
<b>sh4strip</b>	Discard symbols

#### From the GNU make package

<b>make</b>	GNU make
<b>sh4make</b>	GNU make

#### From the GNU GCC package

<b>sh4c++</b>	GNU C++ compiler
<b>sh4cpp</b>	GNU C/C++ preprocessor
<b>sh4g++</b>	GNU C++ compiler
<b>sh4gcc</b>	GNU C compiler
<b>sh4gcov</b>	GNU test coverage tool

### From the GNU GDB/Insight package

<b>sh4gdb</b>	GNU target debugger
<b>sh4insight</b>	Graphical User Interface for the debugger
<b>sh4gdbtui</b>	Text user interface for the debugger
<b>sh4run</b>	GNU SH-4 simulator

### Others

<b>sh4xrun</b>	SuperH target loader
<b>censpect</b>	Statistical data viewer
<b>os21decodetrace</b>	Decodes OS21 Trace output files
<b>os21usertrace</b>	User trace tool for OS21 Trace (implemented as a Perl script)
<b>os21usertracegen</b>	Tool to generate definition files for <b>os21usertrace</b> .
<b>os21prof</b>	OS21 profiler (implemented as a Perl Script)
<b>sh4rltool</b>	Relocatable library tool (implemented as a Perl script)
<b>trcview</b>	Trace data viewer

## 2.2 Software libraries

The toolset supplies libraries for each of the possible target configurations supported by **sh4gcc**. There is one version for each permutation of the SuperH specific compiler options that affect code generation and for the Application Binary Interface (ABI), such as floating-point and endianness. Therefore, for whatever permutation of target configurations a user program is compiled, the compiler driver automatically selects a library with the same permutation (except for optimizations).

### Compiler run-time libraries

The newlib package supplies an ISO/ANSI C run-time library (**libc** and **libm**) and header files. The run-time libraries also provide support for low-level I/O and additional math functions. The Data Transfer Format library (**libdtf**) implements the low-level I/O.

The toolset also supplies an alternative I/O library (**libgloss**) for building applications to run on the GNU GDB SH-4 simulator (**sh4run**) as well as a run-time library (**libprofile**) to support profiling with **sh4gprof**.

### From the GNU GCC package

The GNU GCC package supplies compiler intrinsic libraries (**libgcc** and variants) and a run-time library **libgcov** to support code coverage with **sh4gcov**.

### From the libstdc++ subpackage of the GNU GCC package

The libstdc++ subpackage of the GNU GCC package supplies an ISO/ANSI C++ run-time library (**libstdc++**), and header files that support I/O streams and the standard templates library (the **STL**).

## Others

Other libraries include:

- the OS21 real-time kernel library and header files, and OS21 board support libraries for the various supported platforms
- the relocatable loader library (**librl**) and header files
- the zlib compression library (**libz**) and header files

## 2.3 Documentation

The documentation for the ST40 Micro Toolset includes:

- *ST40 Micro Toolset User Manual* (7379953)
- *ST40 Core Support Peripherals Manual* (7988763)
- *ST40-300 Core Support Peripherals Manual* (8011247)
- *ST40 Micro Toolset GDB Command Scripts* (8045827)
- *ST40 Core Architecture Manual* (7182230)
- *SH-4 Generic and C Specific ABI* (7839242)
- *OS21 User Manual* (7358306)
- *OS21 for ST40 User Manual* (7358673)

## 2.4 Source and example files

The installation delivers the following sets of files:

- the source for the OS21 real-time kernel library
- various example applications, including those using OS21 and showing the construction of Flash ROM systems

## 2.5 Distribution media

The release is distributed through the STMicroelectronics ftp site (<ftp.st.com>). STMicroelectronics supports its products worldwide through Sales Offices and authorized distributors.

Also available for download from the ftp site are:

- STWorkbench for ST40 Micro Toolset
- ST Micro Connection package
- the combined source package containing the open-source components of the ST40 Micro Toolset
- OSPlus base package

## 2.6 Operating requirements

The ST40 Micro Toolset has the following operating requirements.

- The PC package can run on an Intel-compatible PC running Windows XP, Vista or Windows 7.
- The Linux package can run on an Intel-compatible PC running Linux version Red Hat Enterprise Linux 4, 5 or 6.

## 2.7 System interface

The toolset operates in conjunction with the host-target interfaces listed in [Table 1](#).

**Table 1. Host-target interfaces**

Description	Order number
ST Micro Connect 1	None <sup>(1)</sup>
ST Micro Connect 2 with STMC I/O convertor Type A to support a target debug connector type: TTL IDC 20-way JTAG.	STMC2-40/200
ST Micro Connect Lite with both Type A and Type J connectors.	STMCLite-TypeA

1. The ST Micro Connect 1 is a legacy product that can no longer be ordered.

For more information about the ST Micro Connect 2, see the *ST Micro Connect 2 data brief* (8161370) and for more information about the ST Micro Connect Lite, see the *ST Micro Connect Lite data brief* (8298299).
