# STK682-010-E

Thick Film Hybrid IC

## 2-phase Stepping Motor Driver

### Overview

The STK682-010-E is a hybrid IC for use as a Bipolar, 2-phase stepping motor driver with PWM current control.

### Function

- Output on-resistance (High side 0.3  $\Omega$ , Low side 0.25  $\Omega$ , Total 0.55  $\Omega$  ; Ta = 25°C, I<sub>O</sub> = 2.5A)
- VMmax=36V(DC), Iopmax=3.0A
- 2, 1-2, W1-2, 2W1-2, 4W1-2, 8W1-2, 16W1-2, 32W1-2 phase excitation are selectable
- With built-in automatic half current maintenance energizing function
- Over current protection circuit
- Thermal shutdown circuit
- Input pull down resistance
- With reset pin and enable pin

### Specifications

**Absolute Maximum Ratings** at Tc = 25°C

Parameter	Symbol	Conditions	Ratings	Unit
Supply voltage	VMmax		36.0	V
Peak output current	Iopmax		3.0	A
Logic input voltage	VINmax		6.0	V
VREF input voltage	VREFmax		6.0	V
Operating substrate temperature	Tc		-20 to +105	°C
Storage temperature	Tstg		-40 to +125	°C

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

### ORDERING INFORMATION

See detailed ordering and shipping information on page 20 of this data sheet.

## STK682-010-E

### Recommended Operating Conditions at $T_c = 25^\circ\text{C}$

Parameter	Symbol	Conditions	Ratings	Unit
Supply voltage range	VM		9.0 to 32.0	V
Logic input voltage range	VIN		0 to 5.0	V
VCC input voltage range	VCC		0 to 5.0	V
VREF input voltage range	VREF		0 to 3.0	V
Output current1	Io1	1-2 Phase-ex, $T_c \leq 90^\circ\text{C}$	3.0	A
Output current2	Io2	1-2 Phase-ex, $T_c=105^\circ\text{C}$	2.5	A
Output current3	Io3	2 Phase-ex, $T_c=105^\circ\text{C}$	1.8	A

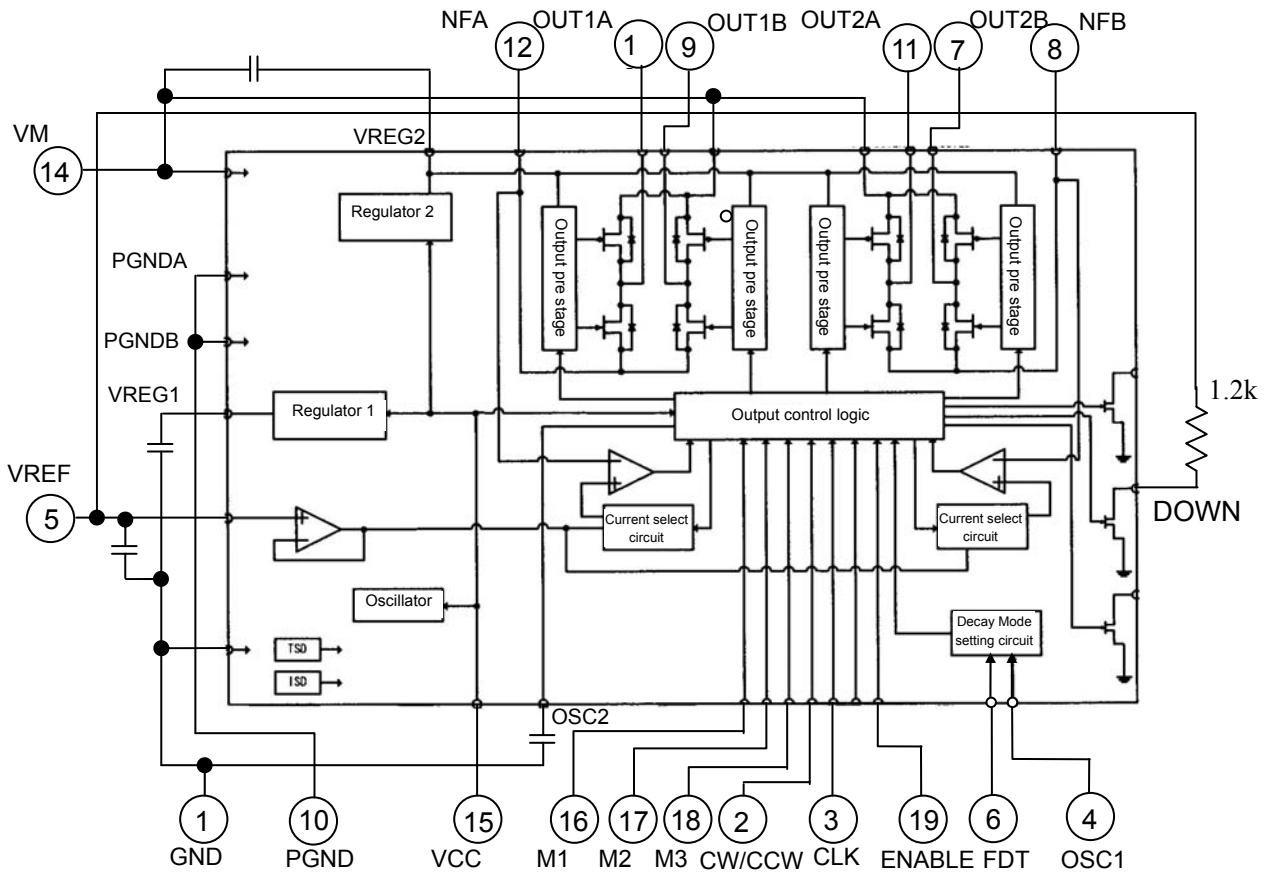

### Electrical Characteristics at $T_c = 25^\circ\text{C}$ , $V_{CC} = 5\text{V}$

Parameter	Symbol	Conditions	Ratings			Unit
			min	typ	max	
Standby mode current drain	IMstn	VCC="L"		70	100	$\mu\text{A}$
Current drain	IM	VCC="H", ENABLE="H" No Load		3.3	4.6	mA
Thermal shutdown temperature	TSD	Design guarantee	150	180	210	$^\circ\text{C}$
Thermal hysteresis width	$\Delta\text{TSD}$	Design guarantee		40		$^\circ\text{C}$
Logic pin input current	linL1	VIN=0.8V	3	8	15	$\mu\text{A}$
	linH1	VIN=5V	30	50	70	$\mu\text{A}$
VCC pin input current	VCC	15pin=5V	51	83	115	$\mu\text{A}$
Logic input high-level voltage	Vinh	Pins 2,3,16,17,18,19	2.0			V
Logic input low-level voltage	Vinl	Pins 2,3,16,17,18,19			0.8	V
FDT pin high-level voltage	Vfdth	Pin 6	3.5			V

**Description of functions**

(1) Excitation setting method

Set the excitation setting as shown in the following table by setting M1 pin, M2 pin and M3 pin

Input signal			MODE (Excitation)	Initial position	
M3	M2	M1		A phase current	B phase current
L	L	L	2 Phase	100%	-100%
L	L	H	1-2 Phase	100%	0%
L	H	L	W1-2 Phase	100%	0%
L	H	H	2W1-2 Phase	100%	0%
H	L	L	4W1-2 Phase	100%	0%
H	L	H	8W1-2 Phase	100%	0%
H	H	L	16W1-2 Phase	100%	0%
H	H	H	32W1-2 Phase	100%	0%

The initial position is also the default state at start-up and excitation position at counter-reset in each excitation mode

(2) Output current setting

Output current is set as shown below by the VREF pin (applied voltage) and a resistance value between NFA (B) pin and GND.

$$I_{OUT} = (VREF / 5) / \text{NFA (B) resistance}$$

\* The setting value above is a 100% output current in each excitation mode.

(Example) When VREF=1.5V and NFA (B) resistance is 0.3 Ω, the setting current is shown below.

$$I_{OUT} = (1.5 \text{ V} / 5) / 0.3 \Omega = 1.0 \text{ A}$$

(3) Chip enable terminal/ VCC function

When Chip enable terminal/ VCC pin is at low levels, the IC enters stand-by mode, all logic is reset and output is turned OFF.

When Chip enable terminal/ VCC pin is at high levels, the stand-by mode is released

(4) Step pin function

CLK pin step signal input allows advancing excitation step

Input		Operation
VCC	CLK	
L	*	Stand-by mode
H		Excitation step feed
H		Excitation step hold

(5) Forward / reverse switching function

CW/CCW	Operation
L	CW
H	CCW

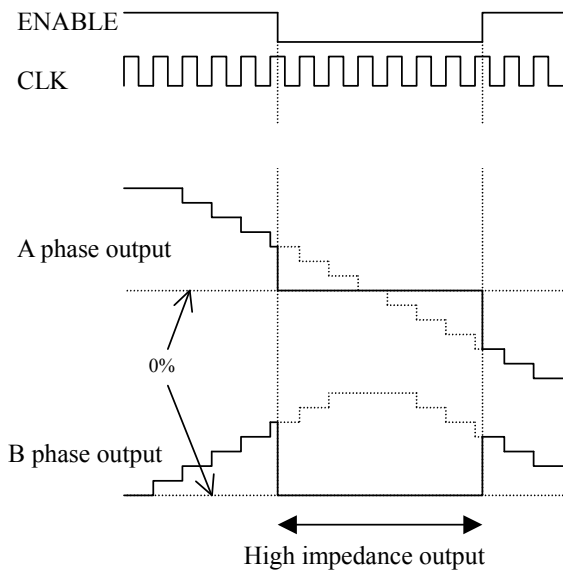

The internal D/A converter proceeds by a bit on the rising edge of the step signal input to the CLK pin. In addition, CW and CCW mode are switched by CW and CCW pin setting.

In CW mode, the B phase current is delayed by 90° relative to the A phase current. In CCW mode, the B phase current is advanced by 90° relative to the A phase current.

(6) Output enable function

When the ENABLE pin is set Low, the output is forced OFF and goes to high impedance. However, the internal logic circuits are operating, so the excitation position proceeds when the CLK is input. Therefore, when ENABLE pin is returned to High, the output level conforms to the excitation position proceeded by the CLK input.

# STK682-010-E

## (7) DECAY mode

The DECAY mode of the output current becomes only MIXED DECAY.

FDT voltage	DECAY method
3.5V to	SLOW DECAY
1.1V to 3.1V or OPEN	MIXED DECAY
to 0.8V	FAST DECAY

## (8) Chopping frequency setting function

Chopping frequency is set as shown below by a capacitor between OSC1 pin and GND.

$$F_{ch} = 1 / (C1 + 20pF / 10 \times 10^{-6}) \text{ (Hz)}$$

(Example) When  $C_{osc1} = 100pF$ , the chopping frequency is shown below.

$$F_{ch} = 1 / ((20 + 100) \times 10^{-12} / 10 \times 10^{-6}) \text{ (Hz)} = 83.3 \text{ (kHz)}$$

Note

- The 20pF is a stray capacitance which is involved by the package of STK682-010-E.

## (9) Output short-circuit protection circuit

Build-in output short-circuit protection circuit makes output to enter in stand-by mode. This function prevents the IC from damaging when the output shorts circuit by a voltage short or a ground short, etc. When output short state is detected, short-circuit detection circuit starts the operating and output is once turned OFF. After the timer latch time (typ : 256 $\mu$ s), output is turned ON again. Still the output is at short state, the output is turned OFF and fixed in stand-by mode.

When output is fixed in stand-by mode by output short protection circuit, output is released the latch by setting Chip enable terminal/  $V_{CC} = "L"$

## (10) Internal DOWN pin

The DOWN pin is an open drain connection.

This pin is turned ON when no rising edge of CLK between the input signals while a period determined by a capacitor between OSC2 and GND, and outputs at low levels.

The DOWN pin output in once turned ON, is turned OFF at the next rising edge of CLK.

Holding current switching time (0.6sectyp) is set by an internal capacitor between OSC2 pin and GND.

## (11) Output current tolerance

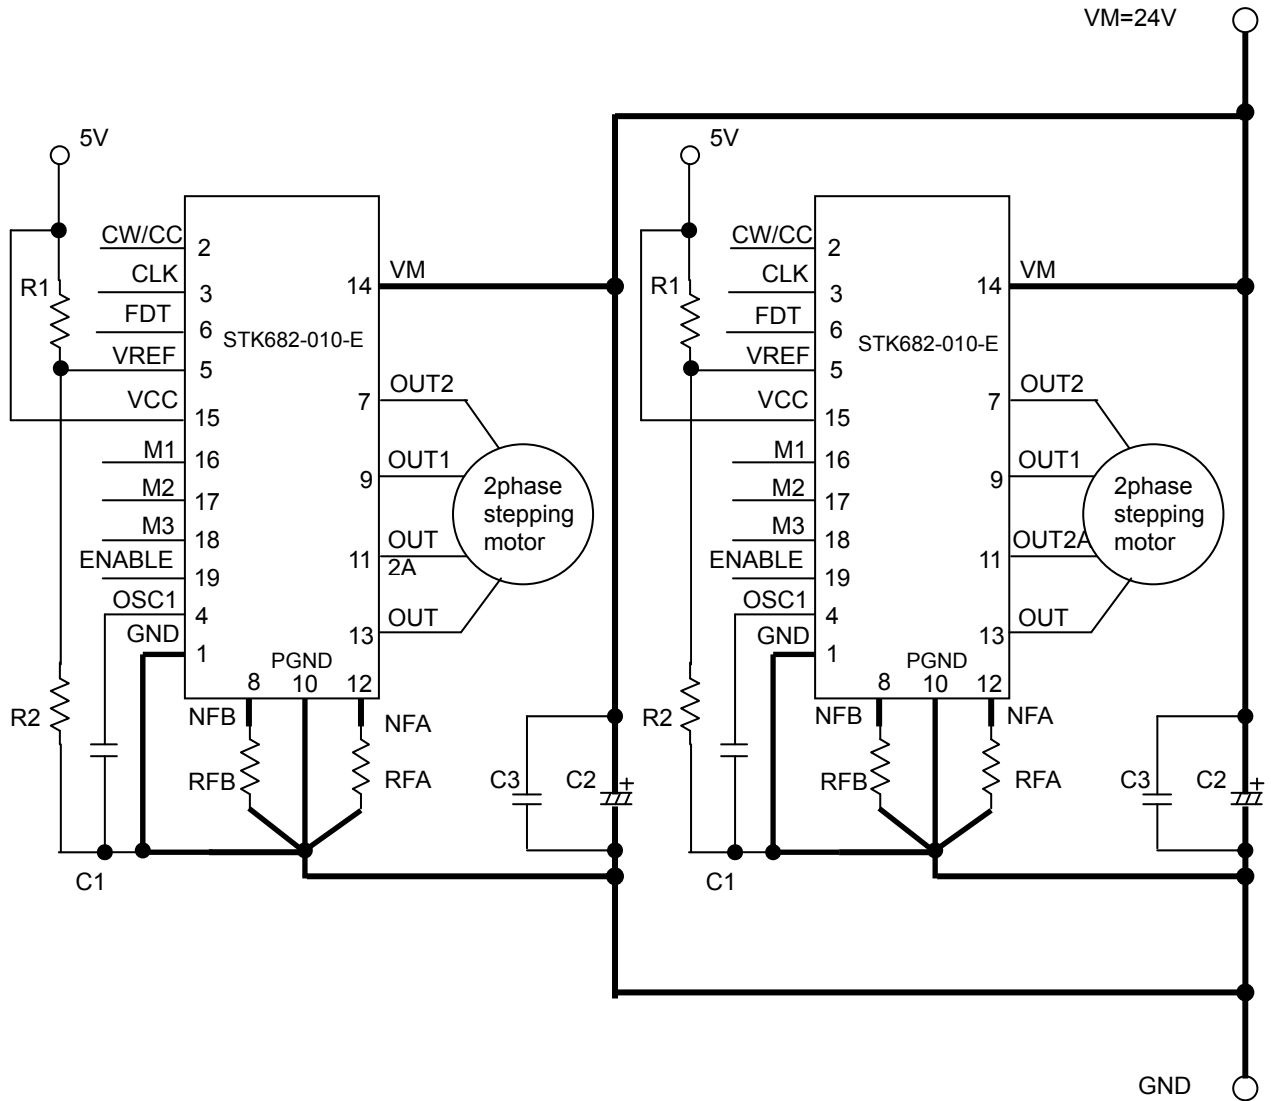

**STK682-010-E Output current tolerance  $I_o - T_c$**

# STK682-010-E

## (12) When mounting multiple drivers on a single PC board

When mounting multiple drivers on a single PC board, the GND design should mount a VCC decoupling capacitor, C2 and C3, for each driver to stabilize the GND potential of the other drivers. The key wiring points are as follows.

# STK682-010-E

1-2 phase excitation (CW mode)

# STK682-010-E

## W1-2 phase excitation (CW mode)

## 4W1-2 phase excitation (CW mode)

(16) Current control operation

SLOW DECAY current control operation

When FDT pin voltage is a voltage over 3.5 V, the constant-current control is operated in SLOW DECAY mode.

(Sine-wave increasing direction)

(Sine-wave decreasing direction)

Each of current modes operates with the follow sequence.

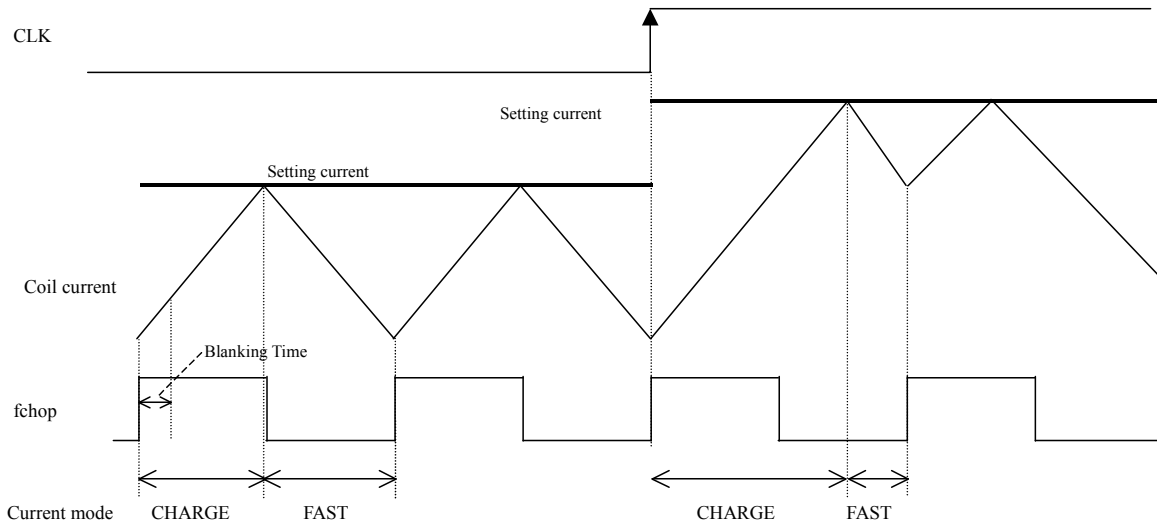

- The IC enters CHARGE mode at a rising edge of the chopping oscillation.  
(A period of CHARGE mode (Blanking Time) is forcibly present in approximately 1  $\mu$ s, regardless of the current value of the coil current (ICOIL) and set current (IREF) ).
- After the period of the blanking time, the IC operates in CHARGE mode until  $ICOIL \geq IREF$ . After that, the mode switches to the SLOW DECAY mode and the coil current is attenuated until the end of a chopping period.

At the constant-current control in SLOW DECAY mode, following to the setting current from the coil current may take time (or not follow) for the current delay attenuation.

FAST DECAY current control operation

When FDT pin voltage is a voltage under 0.8V, the constant-current control is operated in FAST DECAY mode.

(Sine-wave increasing direction)

(Sine-wave decreasing direction)

Each of current modes operates with the follow sequence.

The IC enters CHARGE mode at a rising edge of the chopping oscillation. (A period of CHARGE mode (Blanking Time) is forcibly present in approximately 1 $\mu$ s, regardless of the current value of the coil current (ICOIL) and set current (IREF)).

After the period of the blanking time, The IC operates in CHARGE mode until  $ICOIL \geq IREF$ . After that, the mode switches to the FAST DECAY mode and the coil current is attenuated until the end of a chopping period. At the constant-current control in FAST DECAY mode, following to the setting current from the coil current takes short-time for the current fast attenuation, but, the current ripple value may be higher.

MIXED DECAY current control operation

(Sine-wave increasing direction)

(Sine-wave decreasing direction)

Each of current modes operates with the follow sequence.

The IC enters CHARGE mode at a rising edge of the chopping oscillation.

(A period of CHARGE mode (Blanking Time) is forcibly present in approximately 1  $\mu$ s, regardless of the current value of the coil current (ICOIL) and set current (IREF)).

In a period of Blanking Time, the coil current (ICOIL) and the setting current (IREF) are compared.

If an  $ICOIL = IREF$  state exists during the charge period:

The IC operates in CHARGE mode until  $ICOIL \geq IREF$ . After that, it switches to SLOW DECAY mode and then switches to FAST DECAY mode in the last approximately 1  $\mu$ s of the period.

If no  $ICOIL = IREF$  state exists during the charge period:

The IC switches to FAST DECAY mode and the coil current is attenuated with the FAST DECAY operation until the end of a chopping period.

The above operation is repeated.

Normally, in the sine wave increasing direction the IC operates in SLOW (+FAST) DECAY mode, and in the sine wave decreasing direction the IC operates in FAST DECAY mode until the current is attenuated and reaches the set value and the IC operates in SLOW (+FAST) DECAY mode.

**Power Dissipation**

Power dissipation calculation of STK682-010-E following becomes.

2-phase excitation

$$Pd=IOH \times (Ronu + Rond)^2$$

1-2-phase excitation

$$Pd=0.71 \times IOH \times (Ronu + Rond)^2$$

Please by substituting from electrical characteristic table value of Rond and Ronu.

**Thermal design**

[Operating range in which a heat sink is not used]

Use of a heat sink to lower the operating substrate temperature of the HIC (Hybrid IC) is effective in increasing the quality of the HIC.

The size of heat sink for the HIC varies depending on the magnitude of the average power loss, PdAV, within the HIC. The value of PdAV increases as the output current increases. To calculate PdAV, refer to “Calculating Internal HIC Loss for the STK672-640C-E in the specification document.

Calculate the internal HIC loss, PdAV, assuming repeat operation such as shown in Figure 1 below, since conduction during motor rotation and off time both exist during actual motor operations,

Figure 1 Motor Current Timing

- T1 : Motor rotation operation time
- T2 : Motor hold operation time
- T3 : Motor current off time
- T2 may be reduced, depending on the application.
- T0 : Single repeated motor operating cycle
- IO1 and IO2 : Motor current peak values

Due to the structure of motor windings, the phase current is a positive and negative current with a pulse form.

Note that figure 1 presents the concepts here, and that the on/off duty of the actual signals will differ.

The hybrid IC internal average power dissipation PdAV can be calculated from the following formula.

$$PdAV = (T1 \times P1 + T2 \times P2 + T3 \times 0) \cdot TO \text{ ----- (I)}$$

(Here, P1 is the PdAV for IO1 and P2 is the PdAV for IO2)

If the value calculated using Equation (I) is 1.5W or less, and the ambient temperature, Ta, is 60°C or less, there is no need to attach a heat sink. Refer to Figure 2 for operating substrate temperature data when no heat sink is used.

[Operating range in which a heat sink is used]

Although a heat sink is attached to lower Tc if PdAV increases, the resulting size can be found using the value of c-a in Equation (II) below and the graph depicted in Figure 3.

$$c-a = (Tc \text{ max} - Ta) \cdot PdAV \text{ ----- (II)}$$

Tc max : Maximum operating substrate temperature =105°C

Ta : HIC ambient temperature

Although a heat sink can be designed based on equations (I) and (II) above, be sure to mount the HIC in a set and confirm that the substrate temperature, Tc, is 105°C or less.

Figure 2 Substrate temperature rise,  $\Delta T_c$  (no heat sink) - Internal average power dissipation, PdAV

Figure 3 Heat sink area (Board thickness: 2mm) -  $\theta_{c-a}$

Mitigated Curve of Package Power Loss, PdPK, vs. Ambient Temperature, Ta  
 Package power loss, PdPK, refers to the average internal power loss, PdAV, allowable without a heat sink.  
 The figure below represents the allowable power loss, PdPK, vs. fluctuations in the ambient temperature, Ta.  
 Power loss of up to 3.1W is allowable at Ta=25°C, and of up to 1.75W at Ta=60°C.

Allowable power dissipation, PdPK(no heat sink) - Ambient temperature, Ta
