4-Pin µP Voltage Supervisor with Manual Reset

General Description

The ASM811/ASM812 are cost effective low power supervisors designed to monitor voltage levels of 3.0V, 3.3V and 5.0V power supplies in low-power microprocessor (µP), microcontroller (µC) and digital systems. They provide excellent reliability by eliminating external components and adjustments.

A reset signal is issued if the power supply voltage drops below a preset reset threshold and is asserted for at least 140ms after the supply has risen above the reset threshold. The ASM811 has an active-low output $\overline{\text{RESET}}$ that is guaranteed to be in the correct state for V_{CC} down to 1.1V. The ASM812 has an active-high RESET output. The reset comparator is designed to ignore fast transients on V_{CC}. A debounced manual reset input allows the user to manually reset the systems to bring them out of locked state.

Low power consumption makes the ASM811/ASM812 ideal for use in portable and battery operated equipment. The ASM811/ASM812 are available in a compact 4-pin SOT-143 package and thus use minimal board space.

Six voltage thresholds are available to support 3V to 5V systems:

RESET THRESHOLD	
Suffix	**Voltage (V)**
L	4.63
M	4.38
J	4.00
T	3.08
S	2.93
R	2.63

Features

- New 4.0V threshold option
- 6µA supply current
- Monitor 5V, 3.3V and 3V supplies
- Manual reset input
- 140ms min. reset pulse width
- Guaranteed over temperature
- Active-low reset valid with 1.1V supply (ASM811)
- Small 4-pin SOT-143 package
- No external components
- Power-supply transient-immune design

Applications

- Computers and Controllers
- Embedded controllers
- Portable/Battery operated systems
- Intelligent instruments
- Wireless communication systems
- PDAs and handheld equipments
- Automotive systems
- Safety Systems

Typical Operating Circuit

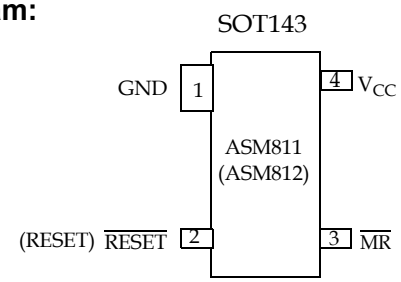
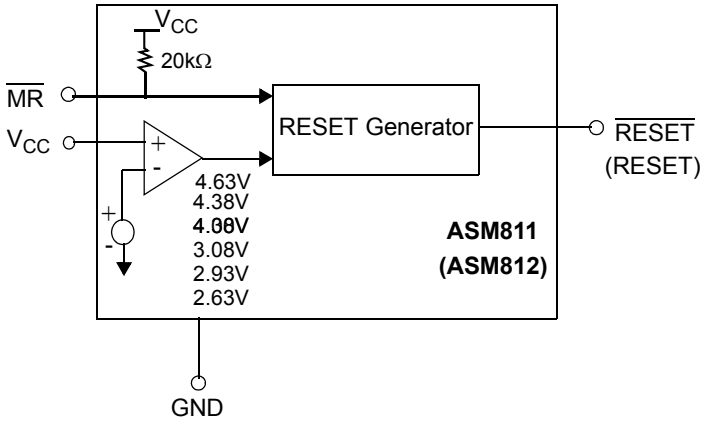
Pin Diagram:



Block Diagram



Pin Description

Pin #		Pin Name	Function
ASM811	ASM812		
1	1	GND	Ground.
2	-	$\overline{RESET}$	$\overline{RESET}$ is asserted LOW if V_{CC} falls below V_{TH}. $\overline{RESET}$ remains LOW for atleast 140ms (T_{RST}) once V_{CC} exceeds the Threshold. In addition, $\overline{RESET}$ is active LOW as long as the manual reset ($\overline{MR}$) is low.
-	2	RESET	RESET is asserted HIGH if V_{CC} falls below V_{TH}. RESET remains HIGH for atleast 140ms (T_{RST}) once V_{CC} exceeds the threshold. In addition, RESET is active HIGH as long as the manual reset ($\overline{MR}$) is low.
3	3	$\overline{MR}$	Manual Reset Input. A logic LOW on $\overline{MR}$ asserts reset. Reset remains active as long as $\overline{MR}$ is LOW and for atleast 180ms (T_{MRST}) once $\overline{MR}$ returns HIGH. The active low input has an internal 20kΩ pull-up resistor. The input should be left open if not used. It can be driven by TTL or CMOS logic or shorted to ground by a switch.
4	4	V_{CC}	Power supply input voltage (3.0V, 3.3V, 5.0V)

Detailed Description

A proper reset input enables a microprocessor / microcontroller to start in a known state. ASM811/812 assert reset to prevent code execution errors during power-up, power-down and brown-out conditions.

Reset Timing

The reset signal is asserted- LOW for the ASM811 and HIGH for the ASM812- when the V_{CC} supply voltage falls below the threshold trip voltage and remains asserted for 140ms minimum after the V_{CC} has risen above the threshold.

Manual Reset ($\overline{MR}$) Input

A logic low on $\overline{MR}$ assserts $\overline{RESET}$ LOW on the ASM811 and RESET HIGH on the ASM812. $\overline{MR}$ is internally pulled high through a 20kΩ resistor and can be driven by TTL/CMOS gates or with open collector/drain outputs. $\overline{MR}$ can be left open if not used. $\overline{MR}$ may be connected to ground through a normally-open momentary switch without an external debounce circuit.

A 0.1µF capacitor from $\overline{MR}$ to ground can be added for additional noise immunity.

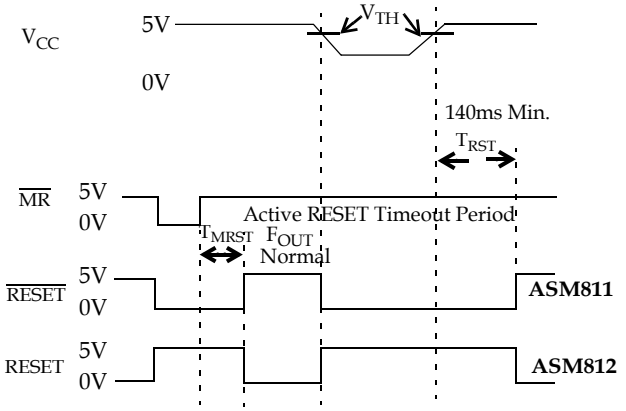


Figure 1: Reset Timing and Manual Reset ($\overline{MR}$)

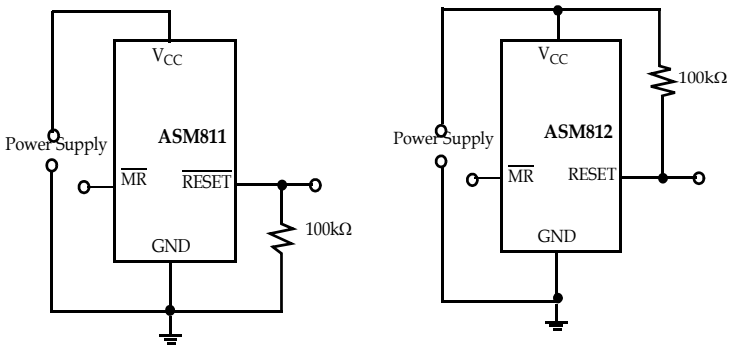
Reset Output Operation

In µP / µC systems it is important to have the processor and the system begin operation from a known state. A reset output to a processor is provided to prevent improper operation during power supply sequencing or low voltage brown-out conditions.

The ASM811/812 are designed to monitor the system power supply voltages and issue a reset signal when the levels are out of range. RESET outputs are guaranteed to be active for V_{CC} above 1.1V. When V_{CC} exceeds the reset threshold, an internal timer keeps RESET active for the reset timeout period, after which RESET becomes inactive (HIGH for the ASM811 and LOW for the ASM812). If V_{CC} drops below the reset threshold, RESET automatically becomes active. Alternatively, external circuitry or an operator can initiate this condition using the Manual Reset ($\overline{MR}$) pin. $\overline{MR}$ can be left open if it is not used. $\overline{MR}$ can be driven by TTL/CMOS logic or even an external switch.

Valid Reset with V_{CC} under 1.1V

To ensure logic inputs connected to the ASM811 $\overline{RESET}$ pin are in a known state when V_{CC} is under 1.1V, a 100kΩ pull-down resistor at $\overline{RESET}$ is needed. The value is not critical. A 100kΩ pull-up resistor to V_{CC} at RESET is needed with the ASM812.



Figures 2 & 3: RESET valid with V_{CC} under 1.1V

Application Information

Negative VCC Transients

Typically short duration transients of 100mV amplitude and 60µs duration do not cause a false RESET. A 0.1µF capacitor at V_{CC} increases transient immunity.

Bidirectional Reset Pin Interfacing

The ASM811/812 can interface with µP / µC bi-directional reset pins by connecting a 4.7kΩ resistor in series with the ASM811/812 reset output and the µP/µC bi-directional reset input pin.

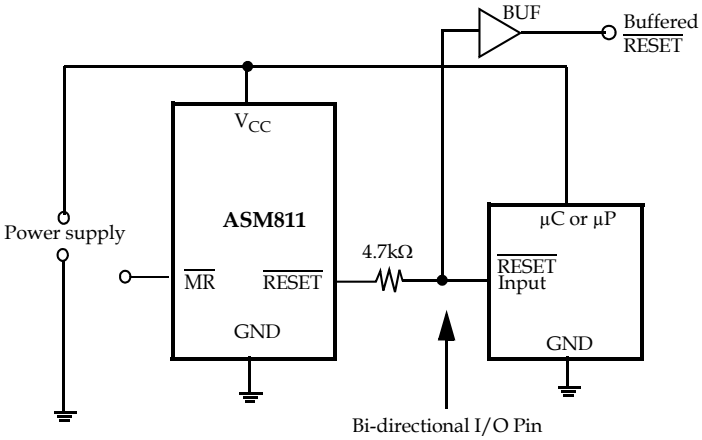


Figure 4: Bi-directional Reset Pin Interface

Absolute Maximum Ratings, Table 1:

Parameter	Min	Max	Units
Pin Terminal Voltage With Respect To Ground			
V_{CC}	-0.3	6.0	V
RESET, $\overline{\text{RESET}}$ and $\overline{\text{MR}}$	-0.3	V_{CC} + 0.3	V
Input current at V_{CC} and $\overline{\text{MR}}$		20	mA
Output current: RESET, $\overline{\text{RESET}}$		20	mA
Rate of Rise at V_{CC}		100	V/µs
ESD rating HBM MM		 2 200	 KV V
Note: These are stress ratings only and the functional operation is not implied. Exposure to absolute maximum ratings for prolonged time periods may affect device reliability.			

Absolute Maximum Ratings, Table 2:

Parameter	Min	Max	Units
Power Dissipation (T_A = 70°C) Derate SOT-143 4mW/°C above 70°C		320	mW
Operating temperature range	-40	105	°C
Storage temperature range	-65	160	°C
Lead temperature (Soldering, 10 sec)		300	°C
Note: These are stress ratings only and the functional operation is not implied. Exposure to absolute maximum ratings for prolonged time periods may affect device reliability.			

Electrical Characteristics:

Unless otherwise noted, V_{CC} is over the full voltage range, T_A = -40°C to 105°C.
Typical values at T_A = 25°C, V_{CC} = 5V for L/M/J devices, V_{CC} = 3.3V for T/S devices and V_{CC} = 3V for R devices.

Symbol	Parameter	Conditions		Min	Typ	Max	Unit
