- ECOPACK®: lead free and RoHS compliant
- Automotive Grade: compliance with AEC guidelines
- Very low stadby current
- CMOS compatible input
- On-state open-load detection
- Off-state open-load detection
- Thermal shutdown protection and diagnosis
- Undervoltage shutdown
- Overvoltage clamp
- Output stuck to V_{CC} detection
- Load current limitation
- Reverse battery protection
- Electrostatic discarge protection

Description

The VN820-E is a monolithic device designed in STMicroelectronic's VIPower $^{\circledR}$ M0-3 technology. The VN820-E is intended for driving any type of load with one side connected to ground. The active V_{CC} pin voltage clamp protects the device against low energy spikes.

Active current limitation combined with thermal shutdown and automatic restart protect the device against overload. The device detects the openload condition in both on- and off-state mode. In the off-state the device detects if the output is shorted to V_{CC} . The device automatically turns off where the ground pin becomes disconnected.

2.1 Absolute maximum ratings

Stressing the device above the rating listed in the *Table 3* may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the operating sections of this specification is not implied. Exposure to Absolute maximum rating conditions for extended periods may affect device reliability.

Table 3.	Absolute maximum rating	S

T _{hyst}	Thermal hysteresis		7	15		°C
t _{SDL}	Status delay in overload condition	$T_j > T_{jsh}$			20	ms
I _{lim}	Current limitation	9 V < V _{CC} < 36 V 5.5 V < V _{CC} < 36 V	9	13	20 20	A A
V _{demag}	Turn-off output clamp voltage	I _{OUT} = 3 A; V _{IN} = 0V; L = 6 mH	V _{CC} - 41	V _{CC} - 48	V _{CC} - 55	V

To ensure long term reliability under heavy overload or short circuit conditions, protection and related diagnostic signals must be used together with a proper software strategy. If the device operates under abnormal conditions this software must limit the duration and number of activation cycles.

3 Application information

Figure 24. Application schematic

3.1 GND protection network against reverse battery

3.1.1 Solution 1: resistor in the ground line (R_{GND} only)

This can be used with any type of load.

The following is an indication on how to set a dimension the R_{GND} resistor.

- 1. $R_{GND} \le 600 \text{ mV} / (I_{S(on)max}).$
- 2. $R_{GND} \ge (-V_{CC}) / (-I_{GND})$

where - I_{GND} is the DC reverse ground pin current and can be found in the absolute maximum rating section of the device datasheet.

Power Dissipation in R_{GND} (when $V_{CC} < 0$: during reverse battery situations) is:

$$P_{D} = (-V_{CC})^2 / R_{GND}$$

This resistor can be shared amongst several different HSDs. Please note that the value of this resistor should be calculated with formula (1) where $I_{S(on)max}$ becomes the sum of the maximum on-state currents of the different devices.

Please note that if the microprocessor ground is not shared by the device ground then the R_{GND} produces a shift ($I_{S(on)max} * R_{GND}$) in the input thresholds and the status output values. This shift does not vary depending on how many devices are ON in case of several high-side drivers sharing the same R_{GND} .

If the calculated power dissipation leads to a large resistor or several devices have to share the same resistor then ST suggests to utilize Solution 2 (see below).

577

18/44 Doc ID 10890 Rev 8

3.1.2 Solution 2: diode (D_{GND}) in the ground line

A resistor (R_{GND} = 1k Ω) should be inserted in parallel to D_{GND} if the device drives an inductive load.

This small signal diode can be safely shared amongst several different HSDs. Also in this case, the presence of the ground network produces a shift (≈600 mV) in the input threshold and in the status output values if the microprocessor ground is not common to the device ground. This shift not varies if more than one HSD shares the same diode/resistor network.

Series resistor in INPUT and STATUS lines are also required to prevent that, during battery voltage transient, the current exceeds the absolute maximum rating.

The safest configuration for unused INPUT and STATUS pin is to leave them unconnected.

3.2 Load dump protection

 D_{ld} is necessary (Voltage Transient Suppressor) if the load dump peak voltage exceeds the V_{CC} max DC rating. The same applies if the device is subject to transients on the V_{CC} line that are greater than the ones shown in the ISO 7637-2: 2004(E) table.

3.3 MCU I/Os protection

If a ground protection network is used and negative transients are present on the V_{CC} line, the control pins are pulled negative. ST suggests to insert a resistor (R_{prot}) in line to prevent the microcontroller I/Os pins from latching-up.

The value of these resistors is a compromise between the leakage current of microcontroller and the current required by the HSD I/Os (Input levels compatibility) with the latch-up limit of μ C I/Os.

 $\text{-}V_{CCpeak}/I_{latchup} \leq R_{prot} \leq (V_{OH\mu C}\text{-}V_{IH}\text{-}V_{GND}) \; / \; I_{IHmax}$

Calculation example:

For V_{CCpeak} = - 100 V and $I_{latchup} \ge 20$ mA; $V_{OH\mu C} \ge 4.5$ V

 $5 kΩ \le R_{prot} \le 65 kΩ$.

Recommended values: $R_{prot} = 10 \text{ k}\Omega$.

3.4 Open-load detection in off-state

Off-state open-load detection requires an external pull-up resistor (R_{PU}) connected between OUTPUT pin and a positive supply voltage (V_{PU}) like the +5 V line used to supply the microprocessor.

The external resistor has to be selected according to the following requirements:

- 1. no false open-load indication when load is connected: in this case we have to avoid V_{OUT} to be higher than V_{Olmin} ; this results in the following condition $V_{OUT} = (V_{PU} / (R_L + R_{PU})) R_L < V_{Olmin}$.
- 2. no misdetection when load is disconnected: in this case the V_{OUT} has to be higher than V_{OLmax} ; this results in the following condition $R_{PU} < (V_{PU} V_{OLmax}) / I_{L(off2)}$.

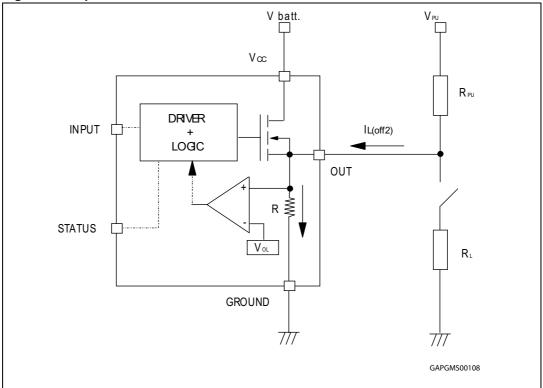

Doc ID 10890 Rev 8

19/44

Because $I_{s(OFF)}$ may significantly increase if V_{out} is pulled high (up to several mA), the pull-up resistor R_{PU} should be connected to a supply that is switched off when the module is in standby.

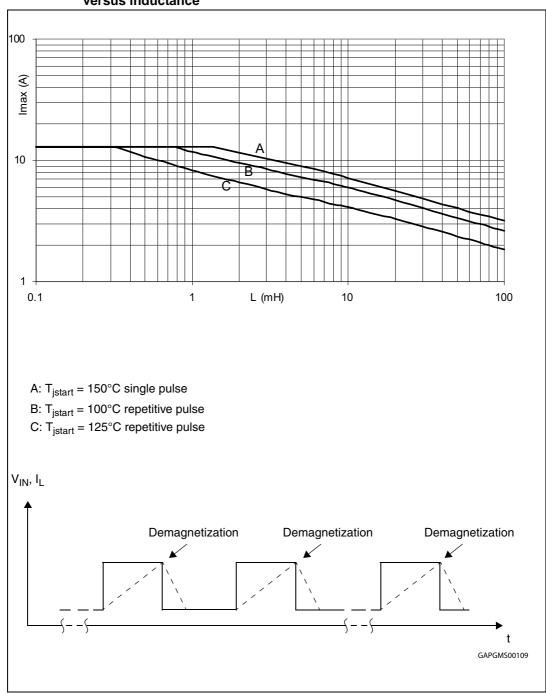

The values of V_{OLmin} , V_{OLmax} and $I_{L(off2)}$ are available in the electrical characteristics section.

Figure 25. Open-load detection in off-state

3.5 PowerSO-10, P²PAK, PPAK, PENTAWATT maximum demagnetization energy (V_{CC} = 13.5V)

Figure 26. PowerSO-10, P²PAK, PPAK, PENTAWATT maximum turn-off current versus inductance

Note:

Values are generated with $R_L = 0~\Omega$. In case of repetitive pulses, T_{jstart} (at beginning of each demagnetization) of every pulse must not exceed the temperature specified above for curves A and B.

VN820-E Revision history

6 Revision history

Table 21. Document revision history

Date	Revision	Changes
07-Dec-2004	1	Initial release.
09-Feb-2005	2	Text changed.
23-Mar-2005	3	Configuration diagram (PowerSO-10) modification.
03-May-2006	4	SO-16L mechanical and shipment data insertion.
17-Dec-2008	5	Document reformatted and restructured. Added content, list of figures and tables. Added ECOPACK® packages information. Updated Figure 45: P2PAK tape and reel (suffix "TR"): - changed component spacing (P) in tape dimensions table from 16 mm to 12 mm.
29-Mar-2010	6	Updated features list. Updated <i>Table 1: Device summary</i> . Updated <i>Table 3: Absolute maximum ratings</i> . Updated <i>Section 3.5: PowerSO-10, P2PAK, PPAK, PENTAWATT maximum demagnetization energy (VCC = 13.5V)</i> . Removed SO-16L package into the document.
07-June-2012	7	Updated Section 5.8: PPAK packing information.
24-Sep-2013	8	Updated Disclaimer.
