

Features

- Low power consumption: 60 μ A max at 16 V
- Supply voltage: 3.3 V to 16 V
- Rail-to-rail input and output
- Gain bandwidth product: 200 kHz typ
- Low offset voltage:
 - 500 μ V max for “A” version
 - 1 mV max for standard version
- Low input bias current: 1 pA typ
- Automotive qualification

Benefits

- Power savings in power-conscious applications
- Easy interfacing with high impedance sensors

Related products

- See TSX56x or TSX92x series for higher gain bandwidth products (900 kHz or 10 MHz)

Applications

- Industrial signal conditioning
- Automotive signal conditioning
- Active filtering
- Medical instrumentation
- High impedance sensors

Description

The TSX63x and TSX63xA series of operational amplifiers offer low voltage operation and rail-to-rail input and output. TSX631 is the single version, TSX632 the dual version and TSX634 the quad version, with pinouts compatible with industry standards.

The TSX63x and TSX63xA series offer a 200 kHz gain bandwidth product while consuming 60 μ A maximum at 16 V.

The devices are housed in the tiniest industrial packages.

These features make the TSX63x and TSX63xA family ideal for sensor interfaces and industrial signal conditioning. The wide temperature range and high ESD tolerance ease the use in harsh automotive applications.

Table 1. Device summary

Op-amp version	Standard V_{io}	Enhanced V_{io}
Single	TSX631	TSX631A
Dual	TSX632	TSX632A
Quad	TSX634	TSX634A

1 Package pin connections

Figure 1. Pin connections for each package (top view)

2 Absolute maximum ratings and operating conditions

Table 2. Absolute maximum ratings (AMR)

Symbol	Parameter	Value	Unit
V_{CC}	Supply voltage ⁽¹⁾	18	V
V_{id}	Differential input voltage ⁽²⁾	$\pm V_{CC}$	
V_{in}	Input voltage ⁽³⁾	$V_{CC-} - 0.2$ to $V_{CC+} + 0.2$	
I_{in}	Input current ⁽⁴⁾	10	mA
T_{stg}	Storage temperature	-65 to +150	°C
R_{thja}	Thermal resistance junction to ambient ⁽⁵⁾⁽⁶⁾		°C/W
	SOT23-5	250	
	DFN8 2x2	120	
	MiniSO-8	190	
	QFN16 3x3	80	
R_{thjc}	Thermal resistance junction to case		°C/W
	DFN8 2x2	33	
	QFN16 3x3	30	
T_j	Maximum junction temperature	160	°C
ESD	HBM: human body model ⁽⁷⁾	4	kV
	MM: machine model ⁽⁸⁾	200	V
	CDM: charged device model ⁽⁹⁾	1.3	kV
	Latch-up immunity	200	mA

1. All voltage values, except the differential voltage are with respect to network ground terminal.
2. The differential voltage is the non-inverting input terminal with respect to the inverting input terminal. See [Section 4.5](#) for precautions of using the TSX631 with high differential input voltage.
3. $V_{CC-} - V_{in}$ must not exceed 18 V, V_{in} must not exceed 18 V.
4. Input current must be limited by a resistor in series with the inputs.
5. Short-circuits can cause excessive heating and destructive dissipation.
6. R_{th} are typical values.
7. Human body model: 100 pF discharged through a 1.5 kΩ resistor between two pins of the device, done for all couples of pin combinations with other pins floating.
8. Machine model: a 200 pF cap is charged to the specified voltage, then discharged directly between two pins of the device with no external series resistor (internal resistor < 5 Ω), done for all couples of pin combinations with other pins floating.
9. Charged device model: all pins plus package are charged together to the specified voltage and then discharged directly to the ground.

Table 3. Operating conditions

Symbol	Parameter	Value	Unit
V_{CC}	Supply voltage	3.3 to 16	V
V_{icm}	Common mode input voltage range	$V_{CC-} - 0.1$ to $V_{CC+} + 0.1$	
T_{oper}	Operating free air temperature range	-40 to +125	°C

3 Electrical characteristics

4 Application information

4.1 Operating voltages

The amplifiers of the TSX63x and TSX63xA series can operate from 3.3 to 16 V. Their parameters are fully specified at 3.3, 5, 10 and 16 V power supplies. However, the parameters are very stable in the full V_{CC} range. Additionally, the main specifications are guaranteed in extended temperature ranges from $-40\text{ }^{\circ}\text{C}$ to $+125\text{ }^{\circ}\text{C}$.

4.2 Rail-to-rail input

The TSX63x and TSX63xA are built with two complementary PMOS and NMOS input differential pairs. The devices have a rail-to-rail input, and the input common mode range is extended from $V_{CC-} - 0.1\text{ V}$ to $V_{CC+} + 0.1\text{ V}$.

However, the performance of these devices is clearly optimized for the PMOS differential pairs (which means from $V_{CC-} - 0.1\text{V}$ to $V_{CC+} - 1.65\text{V}$).

Beyond $V_{CC+} - 1.65\text{ V}$, the op-amp is still functional but with a degraded performance as can be observed in the electrical characteristics section of this datasheet (mainly V_{io}).

These performances are suitable for a number of applications requiring rail-to-rail input and output.

The devices are guaranteed without phase reversal.

4.3 Input offset voltage drift over temperature

The maximum input voltage drift over the temperature variation is defined as the offset variation related to offset value measured at $25\text{ }^{\circ}\text{C}$. The operational amplifier is one of the main circuits of the signal conditioning chain, and the amplifier input offset is a major contributor to the chain accuracy. The signal chain accuracy at $25\text{ }^{\circ}\text{C}$ can be compensated during production at application level. The maximum input voltage drift over temperature enables the system designer to anticipate the effect of temperature variations.

The maximum input voltage drift over temperature is computed using [Equation 1](#).

Equation 1

$$\frac{\Delta V_{io}}{\Delta T} = \max \left| \frac{V_{io}(T) - V_{io}(25\text{ }^{\circ}\text{C})}{T - 25\text{ }^{\circ}\text{C}} \right|$$

with $T = -40\text{ }^{\circ}\text{C}$ and $125\text{ }^{\circ}\text{C}$.

The datasheet maximum value is guaranteed by a measurement on a representative sample size ensuring a C_{pk} (process capability index) greater than 2.

4.4 Long term input offset voltage drift

To evaluate product reliability, two types of stress acceleration are used:

- Voltage acceleration, by changing the applied voltage
- Temperature acceleration, by changing the die temperature (below the maximum junction temperature allowed by the technology) with the ambient temperature.

The voltage acceleration has been defined based on JEDEC results, and is defined using [Equation 2](#).

Equation 2

$$A_{FV} = e^{\beta \cdot (V_S - V_U)}$$

Where:

A_{FV} is the voltage acceleration factor

β is the voltage acceleration constant in $1/V$, constant technology parameter ($\beta = 1$)

V_S is the stress voltage used for the accelerated test

V_U is the voltage used for the application

The temperature acceleration is driven by the Arrhenius model, and is defined in [Equation 3](#).

Equation 3

$$A_{FT} = e^{\frac{E_a}{k} \cdot \left(\frac{1}{T_U} - \frac{1}{T_S} \right)}$$

Where:

A_{FT} is the temperature acceleration factor

E_a is the activation energy of the technology based on the failure rate

k is the Boltzmann constant ($8.6173 \times 10^{-5} \text{ eV.K}^{-1}$)

T_U is the temperature of the die when V_U is used (K)

T_S is the temperature of the die under temperature stress (K)

The final acceleration factor, A_F , is the multiplication of the voltage acceleration factor and the temperature acceleration factor ([Equation 4](#)).

Equation 4

$$A_F = A_{FT} \times A_{FV}$$

A_F is calculated using the temperature and voltage defined in the mission profile of the product. The A_F value can then be used in [Equation 5](#) to calculate the number of months of use equivalent to 1000 hours of reliable stress duration.

Equation 5

$$\text{Months} = A_F \times 1000 \text{ h} \times 12 \text{ months} / (24 \text{ h} \times 365.25 \text{ days})$$

To evaluate the op-amp reliability, a follower stress condition is used where V_{CC} is defined as a function of the maximum operating voltage and the absolute maximum rating (as recommended by JEDEC rules).

The V_{io} drift (in μV) of the product after 1000 h of stress is tracked with parameters at different measurement conditions (see [Equation 6](#)).

Equation 6

$$V_{CC} = \max V_{op} \text{ with } V_{icm} = V_{CC} / 2$$

The long term drift parameter (ΔV_{io}), estimating the reliability performance of the product, is obtained using the ratio of the V_{io} (input offset voltage value) drift over the square root of the calculated number of months ([Equation 7](#)).

Equation 7

$$\Delta V_{io} = \frac{V_{io \text{ drift}}}{\sqrt{(\text{months})}}$$

where V_{io} drift is the measured drift value in the specified test conditions after 1000 h stress duration.

4.5 High values of input differential voltage

In closed loop configuration, which represents the typical use of an op-amp, the input differential voltage is low (close to V_{io}). However, some specific conditions can lead to higher input differential values, such as:

- operation in an output saturation state
- operation at speeds higher than the device bandwidth, with output voltage dynamics limited by slew rate.
- use of the amplifier in a comparator configuration, hence in open loop

Use of the TSX631 in comparator configuration, especially combined with high temperature and long duration can create a permanent drift of V_{io} .

All channels of the dual and quad versions of the TSX632 and TSX634 are virtually unaffected when used in comparator configuration.

4.6 PCB layouts

For correct operation, it is advised to add 10 nF decoupling capacitors as close as possible to the power supply pins.

4.7 Macromodel

Accurate macromodels of the TSX63x and TSX63xA are available on STMicroelectronics' web site at www.st.com. These models are a trade-off between accuracy and complexity (that is, time simulation) of the TSX63x and TSX63xA operational amplifiers. They emulate the nominal performances of a typical device within the specified operating conditions mentioned in the datasheet. They also help to validate a design approach and to select the right operational amplifier, *but they do not replace on-board measurements*.

5 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK[®] packages, depending on their level of environmental compliance. ECOPACK[®] specifications, grade definitions and product status are available at: www.st.com. ECOPACK[®] is an ST trademark.
