Features

- Wide, single supply voltage range or dual supplies +2 V to +36 V or ±1 V to ±18 V
- Very low supply current (0.4 mA) independent of supply voltage (1 mW/comparator at +5 V)
- Low input bias current: 25 nA typ.
- Low input offset current: ±5 nA typ.
- Input common-mode voltage range includes negative rail
- Low output saturation voltage: 250 mV typ. (I_O = 4 mA)
- Differential input voltage range equal to the supply voltage
- TTL, DTL, ECL, MOS, CMOS compatible outputs
- ESD internal protection: 2 kV

Description

This device consists of two independent low-power voltage comparators designed specifically to operate from a single supply over a wide range of voltages. Operation from split power supplies is also possible.

The input common-mode voltage range includes negative rail even though operated from a single power supply voltage.

All pins are protected against electrostatic discharge up to 2 kV. Consequently, the input voltages must not exceed the V_{CC}⁺ or V_{CC}⁻ magnitudes.

	Machine model (MM) ⁽⁴⁾	200	V
	CDM: charged device model ⁽⁵⁾	1500	V

1. Short-circuits from the output to V_{CC+} can cause excessive heating and possible destruction. The maximum output current is approximately 20 mA and is independent of the V_{CC+} magnitude.
2. Short-circuits can cause excessive heating and destructive dissipation. Values are typical and for a four-layer PCB.
3. Human body model: a 100 pF capacitor is charged to the specified voltage, then discharged through a 1.5 kΩ resistor between two pins of the device. This is done for all couples of connected pin combinations while the other pins are floating.
4. Machine model: a 200 pF capacitor is charged to the specified voltage, then discharged directly between two pins of the device with no external series resistor (internal resistor < 5 Ω). This is done for all couples of connected pin combinations while the other pins are floating.
5. Charged device model: all pins and the package are charged together to the specified voltage and then discharged directly to the ground through only one pin. This is done for all pins.

t_{rel}	Large signal response time ⁽⁵⁾ TTL input	$V_{\text{ref}} = +1.4\text{ V}$, $R_L = 5.1\text{ k}\Omega$ to V_{CC+} Output signal at 50 % of final value Output signal at 95 % of final value			500 1	ns μs

- At output switch point, $V_o \approx 1.4\text{ V}$, $R_S = 0\ \Omega$ with V_{CC+} from 5 V to 30 V, and over the full input common-mode range (0 V to $V_{CC+} - 1.5\text{ V}$).
- The direction of the input current is from the IC due to the PNP input stage. This current is essentially constant, independent of the state of the output, so no loading charge exists on the reference of input lines.
- Positive excursions of input voltage may exceed the power supply level. As long as the other voltage remains within the common-mode range, the comparator provides a proper output state. The low input voltage state must not be less than -0.3 V (or 0.3 V below the negative power supply, if used).
- The response time specified is for a 100 mV input step with 5 mV overdrive.
- Maximum values are guaranteed by design and evaluation.
