Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. Temperature Derating: All Packages: See Figure 4.

This device contains circuitry to protect the inputs against damage due to high static voltages or electric fields referenced to the $\mathrm{V}_{\mathrm{SS}}$ pin, only. Extra precautions must be taken to avoid applications of any voltage higher than the maximum rated voltages to this high-impedance circuit. For proper operation, the ranges $V_{S S} \leq V_{\text {in }} \leq 18 \mathrm{~V}$ and $\mathrm{V}_{\text {SS }} \leq \mathrm{V}_{\text {out }} \leq \mathrm{V}_{\mathrm{DD}}$ are recommended.

Unused inputs must always be tied to an appropriate logic voltage level (e.g., either $\mathrm{V}_{\mathrm{SS}}$ or $\mathrm{V}_{\mathrm{DD}}$ ). Unused outputs must be left open.

(Note: Microdot may be in either location)
