### EVAl BOARD USER'S MANUAL

#### INTRODUCTION AND BOARD DESCRIPTION

ON Semiconductor has developed an evaluation board for the NB4L339 Clock Generator as a convenience for customers interested in performing their own device engineering assessment. The board offers a flexible and convenient platform to quickly evaluate, characterize and verify the performance and operation of the NB4L339.

This evaluation board manual contains:

- Information on the NB4L339 Evaluation Board
- Appropriate Lab Setup
- Detailed Board Features
- Bill of Materials

This manual should be used in conjunction with the device datasheet

([www.onsemi.com/pub/Collateral/NB4L339.PDF](http://www.onsemi.com/pub/Collateral/NB4L339.PDF)), which contains full technical details on the device specification and operation.

The NB4L339 Evaluation Board was designed to accommodate a custom QFN-32 socket. Therefore, some external components were installed on the bottom side of the board. SMA connectors are provided for all input & output signal access.

#### Board Layout

The evaluation board is constructed with FR4 material, provides a high bandwidth 50  $\Omega$  controlled trace impedance environment and is designed to minimize noise and minimize crosstalk.

#### Layer Stack

- L1 Signal
- L2 SMA Ground
- L3  $V_{CC}$  (positive power supply) and  $V_{EE}$  (Device negative power supply)
- L4 Signal

#### Board Features

- Incorporates on-board slide switches to manually control CLKSEL, DIVSEL,  $\overline{EN}$  and  $\overline{MR}$  logic pins, minimizing cabling
- 2.5 V or 3.3 V single or split-power supply operation
- LVPECL differential output signals are accessed via SMA connectors
- Convenient and compact board layout

#### What Measurements Can You Expect to Make?

With this evaluation board, the following measurements could be performed in single ended or differential modes of operation.

- Jitter
- Output Skew
- Eye Pattern Generation
- Frequency Performance
- Output Rise and Fall Time
- Phase Noise

## Lab Setup for Time Domain Measurements

Table 1. Basic Lab Equipment

Description	Example Equipment	Qty
Power Supply with 4 outputs	HP6624A	1
Oscilloscope and/or Frequency counter	TDS8000 with 80E01 Sampling Head	1
Differential Signal Generator	Agilent 8133A, Advantest D3186	1
Matched High Speed Cables with SMA Connectors	Storm, Semflex	6 Pair
Digital Voltmeter, Power supply cables		

### Lab Setup

A typical lab setup for taking time domain measurements in differential mode operation is shown in Figure 2. The following steps should be followed for proper equipment setup:

#### Step 1: Connect Power

Three power levels must be provided to the board,  $V_{CC}$ ,  $V_{EE}$ , and  $SMAGND$  via the banana jack connectors on the bottom of the board. Bypass capacitors are installed from  $V_{CC}$  to  $SMAGND$  and  $V_{EE}$  to  $SMAGND$  at the banana jacks and the device pins. Using the split power supply mode,  $GND = V_{TT} = V_{CC} - 2.0\text{ V}$ . The exposed pad of the QFN-32 package is connected to  $V_{EE}$ .

Table 2. NB4L339 Power Supply Connections

3.3 V Setup	2.5 V Setup
$V_{CC} = 2.0\text{ V}$	$V_{CC} = 2.0\text{ V}$
$V_{TT} = SMAGND = 0\text{ V}$	$V_{TT} = SMAGND = 0\text{ V}$
$V_{EE} = -1.3\text{ V}$	$V_{EE} = -0.5\text{ V}$

1.  $SMAGND (V_{TT})$  is the termination supply for the LVPECL outputs only, not to be confused with the device ground pin ( $V_{EE}$ ).

#### Step 2: Connect Inputs

For Differential Mode:

Connect the differential output of the signal generator to the differential input of the device ( $CLKx$  and  $\overline{CLKx}$ ). The differential clock inputs of the NB4L339 incorporate internal  $50\ \Omega$  termination resistors.

For Single-Ended Mode:

Connect the single-ended output of the generator to the  $CLKx$  input of the device.  $V_{th}$  must be applied to the complementary input ( $\overline{CLKx}$ ) when operating in single-ended mode. Refer to the device datasheet for details on single-ended operation.

The VTA and VTB termination pins each have a trace from package pin to a node where it can be connected to either  $V_{CC}$ ,  $V_{EE}$  or  $SMAGND$ , depending on the user's need.

NOTE: Inputs  $CLKA/B$  and  $\overline{CLKA/CLKB}$  must be signal driven or auto oscillation may result.

## NB4L339MNGEVB

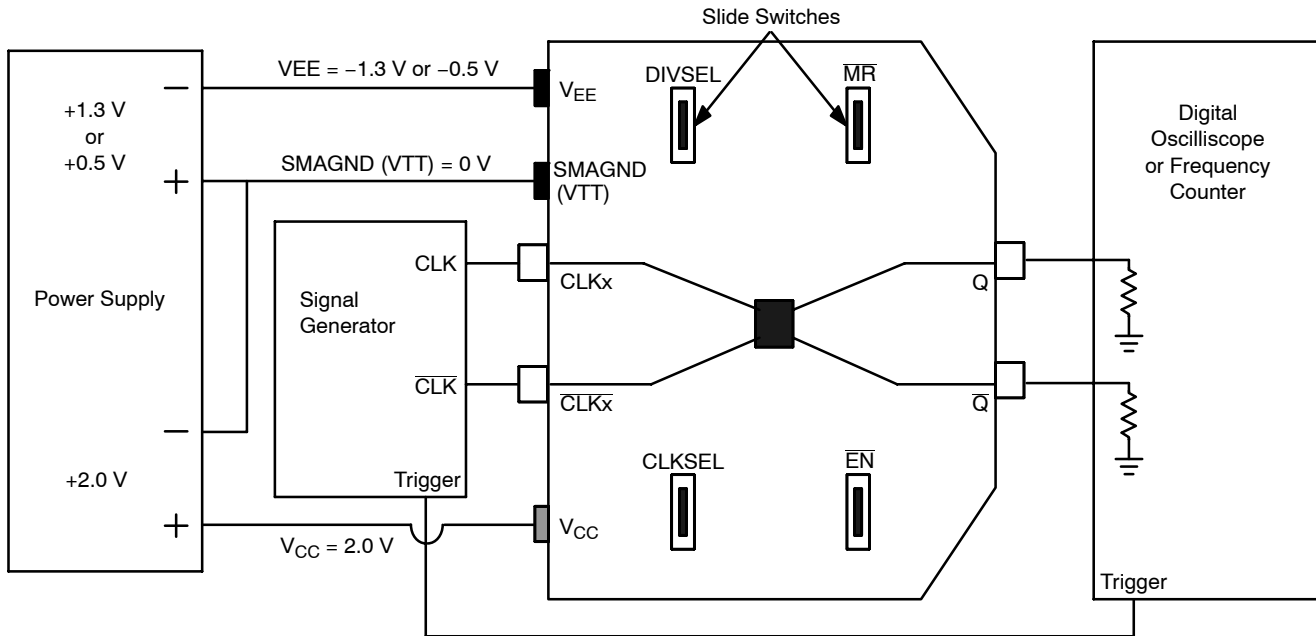

Figure 2. NB4L339 Board Setup Time Domain (Differential Mode)

NOTE: All differential cable pairs **must be** matched.

For single-ended operation,  $\overline{\text{CLKx}}$  needs to be tied to  $V_{\text{TT}}$  through the internal  $50\ \Omega$  resistor.

### Step 3: Setup Input Signals

Set the signal generator output amplitude to 500 mV.

Set the generator output for a square wave clock signal with a 50% duty cycle.

### Step 4: Connect Output Signals

The LVPECL  $Q_{\text{xn}}$  and  $\overline{Q_{\text{xn}}}$  outputs have standard, open emitter outputs and must be externally DC loaded and AC terminated. A split power supply technique takes advantage of terminating the LVPECL outputs into  $50\ \Omega$  of an oscilloscope or a frequency counter. Since  $V_{\text{TT}} = V_{\text{CC}} - 2\ \text{V}$ , offsetting  $V_{\text{CC}}$  to +2.0 V yields  $V_{\text{TT}} = 0\ \text{V}$  or Ground (SMAGND). The  $V_{\text{TT}}$  terminal connects to the isolated SMAGND connector ground plane, and is not to be confused with the device ground pin ( $V_{\text{EE}}$ ).

Connect the Q and  $\overline{Q}$  outputs of the device to the oscilloscope with matched cables. The oscilloscope

sampling head must have internal  $50\ \Omega$  termination to ground.

NOTE: When single-ended output is being used, the unconnected output for the pair **must be** terminated to  $V_{\text{TT}}$  through a  $50\ \Omega$  resistor for best operation. Unused outputs pairs may be left unconnected. Since  $V_{\text{TT}} = 0\ \text{V}$ , a standard  $50\ \Omega$  SMA termination is recommended.

### Step 5: Set CLKSEL, DIVSEL, $\overline{\text{EN}}$ and $\overline{\text{MR}}$

The CLKSEL, DIVSEL,  $\overline{\text{EN}}$  and  $\overline{\text{MR}}$  control pins can be controlled from an external source via the appropriate SMA connector, or using the slide switches located on the board, as indicated in Figure 2. In order to use the slide switches, the jumpers/shunts on the bottom side of the board must be installed. When using an external source, remove the jumper for that pin. Refer to the NB4L339 datasheet for details on the proper settings for these pins.

**Table 3. Detailed board features by device pin.**

Pin	Name	Feature
11, 12, 13, 14, 17, 18, 19, 20, 27, 28, 29, 30	$Q_{xn}$ , $\overline{Q_{xn}}$	All of the $Q_{xn}$ & $\overline{Q_{xn}}$ LVPECL outputs have equal length 50 $\Omega$ impedance board traces with SMA connectors. Matched cables can connect to an oscilloscope or frequency counter.
9, 16, 25, 32	$V_{CC}$	The $V_{CC}$ pins are all connected directly to the $V_{CC}$ power plane. Bypass capacitors are installed at each pin.
2, 4, 5, 7	$CLK_x$ , $\overline{CLK_x}$	The $CLK_x$ & $\overline{CLK_x}$ Clock input pins have equal length board traces with SMA connectors. Matched cables can connect to a signal generator.  Resistors R1–R4 are intended to terminate a signal generator with 50 $\Omega$ to ground, if needed. They have been (should be) removed since the NB4L339 already provides internal 50 $\Omega$ termination resistors for a signal generator when $VT_x$ is connected to SMAGND in a split-power supply configuration.
3, 6	VTA, VTB	The VTA and VTB pins each have a trace from package pin to a node where it can be connected to either $V_{CC}$ , $V_{EE}$ or SMAGND, depending on the user's need.
10, 31, 15, 26	CLKSEL, DIVSEL, $\overline{EN}$ , $\overline{MR}$	Slide Switch Control The board incorporates slide switches to manually control the logic levels for the CLKSEL, DIVSEL, $\overline{EN}$ and $\overline{MR}$ control pins, thus, minimizing cabling. In order to use the slide switches, the jumpers/shunts on the bottom side of the board must be installed.  External Control The CLKSEL, DIVSEL, $\overline{EN}$ and $\overline{MR}$ control pins can be controlled from an external source via the appropriate SMA connector. A 50 $\Omega$ resistor is installed from the trace to SMAGND to terminate a signal generator, if needed. When using an external source, remove the switch jumper/shunt from the bottom of the board.
--	EP	The exposed pad of the QFN–32 package is connected to $V_{EE}$ .

2. NOTE. x = A, B, C, or D; n = 0 or 1
