1. SCOPE

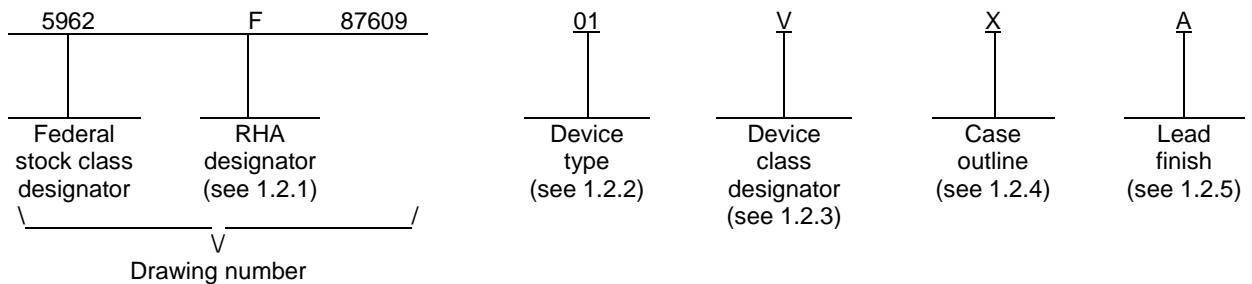

1.1 Scope. This drawing documents two product assurance class levels consisting of high reliability (device classes Q and M) and space application (device class V). A choice of case outlines and lead finishes are available and are reflected in the Part or Identifying Number (PIN). When available, a choice of Radiation Hardness Assurance (RHA) levels is reflected in the PIN.

1.2 PIN. The PIN is as shown in the following examples.

For device class M and Q:

For device class V:

1.2.1 RHA designator. Device classes Q and V RHA marked devices meet the MIL-PRF-38535 specified RHA levels and are marked with the appropriate RHA designator. Device class M RHA marked devices meet the MIL-PRF-38535, appendix A specified RHA levels and are marked with the appropriate RHA designator. A dash (-) indicates a non-RHA device.

1.2.2 Device type(s). The device type(s) identify the circuit function as follows:

<u>Device type</u>	<u>Generic number</u>	<u>Circuit function</u>
01	54AC04	Hex inverter
02	54AC11004	Hex inverter

1.2.3 Device class designator. The device class designator is a single letter identifying the product assurance level as listed below. Since the device class designator has been added after the original issuance of this drawing, device classes M and Q designators will not be included in the PIN and will not be marked on the device.

<u>Device class</u>	<u>Device requirements documentation</u>
M	Vendor self-certification to the requirements for MIL-STD-883 compliant, non-JAN class level B microcircuits in accordance with MIL-PRF-38535, appendix A

TABLE IA. Electrical performance characteristics - Continued.

- 3/ RHA parts for device type 01 of this drawing have been characterized through all levels M, D, P, L, R, and F of irradiation. However, these devices are only tested at the 'F' level. Pre and post irradiation values are identical unless otherwise specified in table IA. When performing post irradiation electrical measurements for any RHA level,  $T_A = +25^\circ\text{C}$ .
- 4/ For negative and positive voltage and current values, the sign designates the potential difference in reference to GND and the direction of current flow, respectively; and the absolute value of the magnitude, not the sign, is relative to the minimum and maximum limits, as applicable, listed herein. All devices shall meet or exceed the limits specified in table I, as applicable, at  $3.0\text{ V} \leq V_{CC} \leq 3.6\text{ V}$  and  $4.5\text{ V} \leq V_{CC} \leq 5.5\text{ V}$ .
- 5/ The  $V_{OH}$  and  $V_{OL}$  tests shall be tested at  $V_{CC} = 3.0\text{ V}$  and  $4.5\text{ V}$ . The  $V_{OH}$  and  $V_{OL}$  tests are guaranteed, if not tested, for other values of  $V_{CC}$ . Limits shown apply to operation at  $V_{CC} = 3.3\text{ V} \pm 0.3\text{ V}$  and  $V_{CC} = 5.0\text{ V} \pm 0.5\text{ V}$ . Tests with input current at  $+50\text{ mA}$  or  $-50\text{ mA}$  are performed on only one input at a time with duration not to exceed 10 ms. Transmission driving tests may be performed using  $V_{IN} = V_{CC}$  or GND. When  $V_{IN} = V_{CC}$  or GND is used, the test is guaranteed for  $V_{IN} = V_{IH}$  minimum and  $V_{IL}$  maximum.
- 6/ The  $V_{IH}$  and  $V_{IL}$  tests are not required if applied as forcing functions for  $V_{OH}$  and  $V_{OL}$  tests.
- 7/ The maximum limit for this parameter at 100 krads (Si) is  $2\ \mu\text{A}$ .
- 8/ Power dissipation capacitance ( $C_{PD}$ ) determines both the power consumption ( $P_D$ ) and dynamic current consumption ( $I_S$ ). Where:  

$$P_D = (C_{PD} + C_L) (V_{CC} \times V_{CC})f + (I_{CC} \times V_{CC})$$

$$I_S = (C_{PD} + C_L) V_{CC}f + I_{CC}$$
 f is the frequency of the input signal and  $C_L$  is the external output load capacitance.
- 9/ Tests shall be performed in sequence, attributes data only. Functional tests shall include the truth table and other logic patterns used for fault detection. The test vectors used to verify the truth table shall, at a minimum, test all functions of each input and output. All possible input to output logic patterns per function shall be guaranteed, if not tested, to the truth table in figure 2 herein. Functional tests shall be performed in sequence as approved by the qualifying activity on qualified devices. For  $V_{OUT}$  measurements,  $L \leq 0.3V_{CC}$  and  $H \geq 0.7V_{CC}$ .
- 10/ AC limits at  $V_{CC} = 5.5\text{ V}$  are equal to the limits at  $V_{CC} = 4.5\text{ V}$  and guaranteed by testing at  $V_{CC} = 4.5\text{ V}$ . AC limits at  $V_{CC} = 3.6\text{ V}$  are equal to limits at  $V_{CC} = 3.0\text{ V}$  and guaranteed by testing at  $V_{CC} = 3.0\text{ V}$ . Minimum ac limits for  $V_{CC} = 5.5\text{ V}$  and  $V_{CC} = 3.6\text{ V}$  are  $1.0\text{ ns}$  and guaranteed by guardbanding the  $V_{CC} = 4.5\text{ V}$  and  $V_{CC} = 3.0\text{ V}$  minimum limits, respectively, to  $1.5\text{ ns}$ . For propagation delay tests, all paths must be tested.
