

Positive Doubling Charge Pumps with Shutdown in a SOT-23 Package

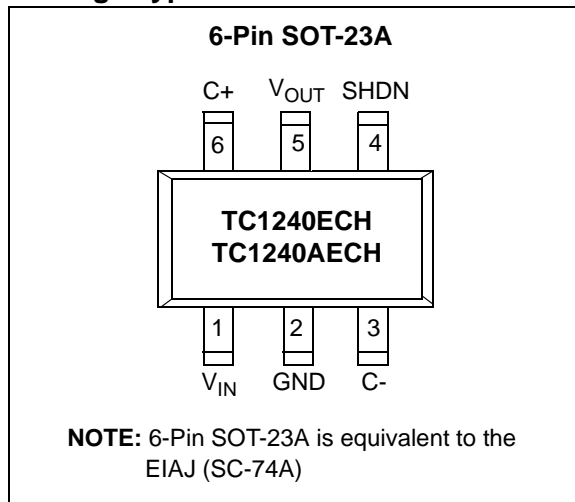

Features

- Charge Pumps in 6-Pin SOT-23A Package
- >99% Typical Voltage Conversion Efficiency
- Voltage Doubling
- Input Voltage Range, TC1240: +2.5V to +4.0V,
TC1240A: +2.5V to +5.5V
- Low Output Resistance, TC1240: 17Ω (Typical)
TC1240A: 12Ω (Typical)
- Only Two External Capacitors Required
- Low Supply Current, TC1240: 180 μA (Typical)
TC1240A: 550 μA (Typical)
- Power-Saving Shutdown Mode (1 μA Maximum)
- Shutdown Input Fully Compatible with 1.8V Logic Systems

Applications

- Cellular Phones
- Pagers
- PDAs, Portable Data Loggers
- Battery Powered Devices
- Handheld Instruments

Package Type

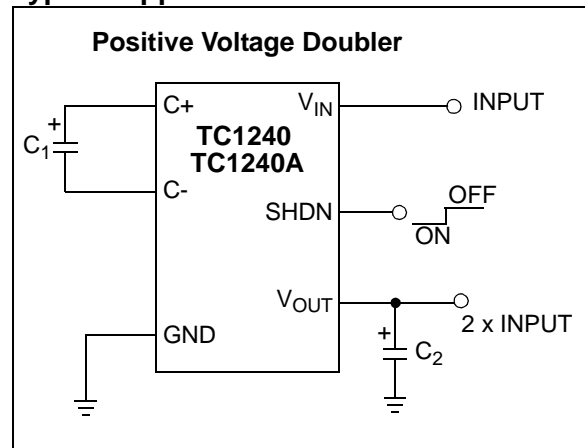

General Description

The TC1240/TC1240A is a doubling CMOS charge pump voltage converter in a small 6-Pin SOT-23A package. The TC1240 doubles an input voltage that can range from +2.5V to +4.0V, while the TC1240A doubles an input voltage that can range from +2.5V to +5.5V. Conversion efficiency is typically >99%. Internal oscillator frequency is 160 kHz for both devices. The TC1240 and TC1240A have an active-high shutdown that limits the current consumption of the devices to less than 1 μA.

External component requirement is only two capacitors for standard voltage doubler applications. All other circuitry (including control, oscillator and power MOSFETs) are integrated on-chip. Typical supply current is 180 μA for the TC1240 and 550 μA for the TC1240A. Both devices are available in a 6-Pin SOT-23A surface mount package.

Typical Application Circuit

TC1240/TC1240A

1.0 ELECTRICAL CHARACTERISTICS

Absolute Maximum Ratings †

Input Voltage (V_{IN} to GND)	
TC1240	+4.5V, -0.3V
TC1240A	+5.8V, -0.3V
Output Voltage (V_{OUT} to GND)	
TC1240	+9.0V, V_{IN} -0.3V
TC1240A	+11.6V, V_{IN} -0.3V
Current at V_{OUT} Pin.....	50 mA
Short-Circuit Duration: V_{OUT} to GND	Indefinite
Thermal Resistance	210°C/W
Power Dissipation ($T_A = +25^\circ\text{C}$).....	600 mW
Operating Temperature Range.....	-40°C to +85°C
Storage Temperature (Unbiased)	-65°C to +150°C

† Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions above those indicated in the operation sections of the specifications is not implied. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability.

TC1240 ELECTRICAL SPECIFICATIONS

Electrical Specifications: Unless otherwise noted, typical values apply at $T_A = +25^\circ\text{C}$. Minimum and maximum values apply for $T_A = -40^\circ$ to $+85^\circ\text{C}$, and $V_{IN} = +2.8\text{V}$, $C_1 = C_2 = 3.3 \mu\text{F}$, SHDN = GND.

Parameters	Sym	Min	Typ	Max	Units	Conditions
Supply Current	I_{DD}	—	180	300	μA	$R_{LOAD} = \infty$
Shutdown Supply Current	I_{SHDN}	—	0.1	1.0	μA	SHDN = V_{IN}
Minimum Supply Voltage	V_{MIN}	2.5	—	—	V	$R_{LOAD} = 1.0 \text{ k}\Omega$
Maximum Supply Voltage	V_{MAX}	—	—	4.0	V	$R_{LOAD} = 1.0 \text{ k}\Omega$
Oscillator Frequency	F_{OSC}	—	160	—	kHz	$T_A = -40^\circ\text{C}$ to $+85^\circ\text{C}$
Switching Frequency (Note 1)	F_{SW}	40	80	125	kHz	$T_A = -40^\circ\text{C}$ to $+85^\circ\text{C}$
Shutdown Input Logic High	V_{IH}	1.4	—	—	V	$V_{IN} = V_{MIN}$ to V_{MAX}
Shutdown Input Logic Low	V_{IL}	—	—	0.4	V	$V_{IN} = V_{MIN}$ to V_{MAX}
Power Efficiency	P_{EFF}	86	93	—	%	$R_{LOAD} = 1.0 \text{ k}\Omega$
Voltage Conversion Efficiency	V_{EFF}	97.5	99.96	—	%	$R_{LOAD} = \infty$
Output Resistance (Note 2)	R_{OUT}	—	17	—	Ω	$R_{LOAD} = 1.0 \text{ k}\Omega$ $T_A = -40^\circ\text{C}$ to $+85^\circ\text{C}$

Note 1: Switching frequency is one-half internal oscillator frequency.

Note 2: Capacitor contribution is approximately 26% of the output impedance [ESR = $1 / \text{switching frequency} \times \text{capacitance}$].

TC1240A ELECTRICAL SPECIFICATIONS

Electrical Specifications: Unless otherwise noted, typical values apply at $T_A = +25^\circ\text{C}$. Minimum and maximum values apply for $T_A = -40^\circ$ to $+85^\circ\text{C}$, and $V_{IN} = +5.0\text{V}$, $C_1 = C_2 = 3.3\ \mu\text{F}$, $\text{SHDN} = \text{GND}$.

Parameters	Sym	Min	Typ	Max	Units	Conditions
Supply Current	I_{DD}	—	550	900	μA	$R_{LOAD} = \infty$
Shutdown Supply Current	I_{SHDN}	—	0.01	1.0	μA	$\text{SHDN} = V_{IN}$

TC1240/TC1240A

3.0 PIN DESCRIPTION

The description of the pins are listed in Table 3-1.

TABLE 3-1: PIN FUNCTION TABLE

Pin No.	Symbol	Description
1	V_{IN}	Power supply input
2	GND	Ground
3	C-	Commutation capacitor negative terminal
4	SHDN	Shutdown input (active high)
5	V_{OUT}	Doubled output voltage
6	C+	Commutation capacitor positive terminal

4.0 DETAILED DESCRIPTION

The TC1240/TC1240A charge pump converter doubles the voltage applied to the V_{IN} pin. Conversion consists of a two-phase operation (Figure 4-1). During the first phase, switches S_2 and S_4 are open and S_1 and S_3 are closed. During this time, C_1 charges to the voltage on V_{IN} and load current is supplied from C_2 . During the second phase, S_2 and S_4 are closed, while S_1 and S_3 are open.

During this second phase, C_1 is level-shifted upward by V_{IN} volts. This connects C_1 to the reservoir capacitor C_2 , allowing energy to be delivered to the output as needed. The actual voltage is slightly lower than $2 \times V_{IN}$ since the four switches (S_1 - S_4) have an on-resistance and the load drains charge from reservoir capacitor C_2 .

FIGURE 4-1: Ideal Switched Capacitor Charge Pump Doubler.

5.0 TYPICAL APPLICATIONS

5.1 Output Voltage Considerations

The TC1240/TC1240A performs voltage doubling but does not provide regulation. The output voltage will droop in a linear manner with respect to load current. The value of this equivalent output resistance is approximately 12Ω nominal at $+25^\circ\text{C}$ and $V_{IN} = +5.0\text{V}$ for the TC1240A and 17Ω nominal at $+25^\circ\text{C}$ and $V_{IN} = +2.8\text{V}$ for the TC1240. V_{OUT} is approximately $+10.0\text{V}$ at light loads for the TC1240A and $+5.6\text{V}$ for the TC1240, and droops according to the equation below:

EQUATION

$$V_{DROOP} = I_{OUT} \times R_{OUT}$$

$$V_{OUT} = 2 \times V_{IN} - V_{DROOP}$$

5.2 Charge Pump Efficiency

The overall power efficiency of the charge pump is affected by four factors:

1. Losses from power consumed by the internal oscillator, switch drive, etc. (which vary with input voltage, temperature and oscillator frequency).
2. I^2R losses due to the on-resistance of the MOSFET switches on-board the charge pump.
3. Charge pump capacitor losses due to effective series resistance (ESR).
4. Losses that occur during charge transfer (from commutation capacitor to the output capacitor) when a voltage difference between the two capacitors exist.

Most of the conversion losses are due to factors (2) and (3) above. These losses are given by Equation 5-1.

EQUATION 5-1:

$$\text{a) } P_{LOSS(2,3)} = I_{OUT}^2 \times R_{OUT}$$

$$\text{b) } R_{OUT} = \left[\frac{I}{F_{SW}(C_1)} \right] + 8R_{SWITCH} + 4ESR_{C1} + ESR_{C2}$$

TC1240/TC1240A

The switching frequency in Equation 5-1b is defined as one-half the oscillator frequency (i.e., $F_{SW} = F_{OSC}/2$). The $1/(F_{SW})(C_1)$ term in Equation 5-1b is the effective output resistance of an ideal switched capacitor circuit (Figure 5-1 and Figure 5-2).

The output voltage ripple is given by Equation 5-2.

EQUATION 5-2:

$$V_{RIPPLE} = \frac{I_{OUT}}{2(F_{SW})(C_2)} + 2(I_{OUT})(ESR_{C2})$$

FIGURE 5-1: Ideal Switched Capacitor Model.

FIGURE 5-2: Equivalent Output Resistance.

5.3 Capacitor Selection

In order to maintain the lowest output resistance and output ripple voltage, it is recommended that low ESR capacitors be used. Additionally, larger values of C_1 will lower the output resistance and larger values of C_2 will reduce output ripple (see Equation 5-1b).

Table 5-1 shows various values of C_1 and the corresponding output resistance values @ +25°C. It assumes a 0.1Ω ESR_{C1} and 0.9Ω R_{SW} . Table 5-2 shows the output voltage ripple for various values of C_2 . The V_{RIPPLE} values assume 5mA output load current and 0.1Ω ESR_{C2} .

TABLE 5-1: OUTPUT RESISTANCE VS. C_1 (ESR = 0.1Ω)

C_1 (μF)	TC1240 $R_{OUT}(\Omega)$	TC1240A $R_{OUT}(\Omega)$
0.47	47	35
1	28.5	20.5
2.2	19.5	14
3.3	17	12
4.7	15.5	10.5
10	13.6	9.3
47	12.5	8.3
100	12.2	8.1

TABLE 5-2: OUTPUT VOLTAGE RIPPLE VS. C_2 (ESR = 0.1Ω) I_{OUT} 5 mA

C_1 (μF)	TC1240/TC1240A V_{RIPPLE} (mV)
0.47	142
1	67
2.2	30
3.3	20
4.7	14
10	6.7
47	2.5
100	1.6

5.4 Input Supply Bypassing

The V_{IN} input should be capacitively bypassed to reduce AC impedance and minimize noise effects due to the switching internal to the device. The recommended capacitor should be a large value (at least equal to C_1) connected from the input to GND.

5.5 Shutdown Input

The TC1240 and TC1240A are disabled when SHDN is high, and enabled when SHDN is low. This input cannot be allowed to float.

5.6 Voltage Doubler

The most common application for charge pump devices is the doubler (Figure 5-3). This application uses two external capacitors – C_1 and C_2 (plus a power supply bypass capacitor, if necessary). The output is equal to $2 \times V_{IN}$ minus any voltage drops due to loading. Refer to Table 5-1 and Table 5-2 for capacitor selection.

FIGURE 5-3: Test Circuit.

TC1240/TC1240A

5.7 Cascading Devices

Two or more TC1240/TC1240As can be cascaded to increase output voltage (Figure 5-4). If the output is lightly loaded, it will be close to $(n + 1) \times V_{IN}$, but will droop at least by R_{OUT} of the first device multiplied by the I_Q of the second. It can be seen that the output resistance rises rapidly for multiple cascaded devices. For the case of the two-stage 'tripler', output resistance can be approximated as $R_{OUT} = 2 \times R_{OUT1} + R_{OUT2}$, where R_{OUT1} is the output resistance of the first stage and R_{OUT2} is the output resistance of the second stage.

5.8 Paralleling Devices

To reduce the value of R_{OUT} , multiple TC1240/TC1240As can be connected in parallel (Figure 5-5). The output resistance will be reduced by a factor of N , where N is the number of TC1240/TC1240As. Each device will require its own pump capacitor (C_{1x}), but all devices may share one reservoir capacitor (C_2). However, to preserve ripple performance, the value of C_2 should be scaled according to the number of paralleled TC1240/TC1240As, respectively.

5.9 Layout Considerations

As with any switching power supply circuit good layout practice is recommended. Mount components as close together as possible to minimize stray inductance and capacitance. Also use a large ground plane to minimize noise leakage into other circuitry.

FIGURE 5-4: Cascading Multiple Devices To Increase Output Voltage.

FIGURE 5-5: Paralleling Multiple Devices To Reduce Output Resistance.

TC1240/TC1240A

NOTES:

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights.
