

Features

- Synchronizes with standard telecom system references and synthesizes a wide variety of protected telecom line interface clocks that are compliant with Telcordia GR-253-CORE and ITU-T G.813
- Internal APLL provides standard output clock frequencies up to 622.08 MHz that meet jitter requirements for interfaces up to OC-192/STM-64
- Programmable output synthesizer generates clock frequencies from any multiple of 8 kHz up to 77.76 MHz in addition to 2 kHz
- Digital Phase Locked-Loop (DPLL) provides all the features necessary for generating SONET/SDH compliant clocks including automatic hitless reference switching, automatic mode selection (locked, free-run, holdover), and selectable loop bandwidth
- Provides 3 reference inputs which support clock frequencies with any multiples of 8 kHz up to 77.76 MHz in addition to 2 kHz

Changes Summary

The following table captures the changes from the February 2006 issue.

| Page | Item | Change |
|-------|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 20-21 | Software Register Description | Changed the naming and description of the frame pulse delay offset registers to clearly show that they form a 22-bit register spread out over 3 8-bit registers. The 22-bit register must be considered a multi-byte register during a read or write operation. This affects registers 0x40-0x42, and 0x58-0x5A. |

Pin Description

| Pin # | Name | I/O Type | Description |
|---------------------------------------|--------------------------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input Reference | | | |
| B1 A3 B4 | ref0 ref1 ref2 | I _d | Input References (LVCMOS, Schmitt Trigger). These are input references available for synchronizing output clocks. All three input references can be automatically or manually selected using software registers. These pins are internally pulled down to V _{ss} . |
| A1 A2 A4 | sync0 sync1 sync2 | I _d | Frame Pulse Synchronization References (LVCMOS, Schmitt Trigger). These are the frame pulse synchronization inputs associated with input references 0, 1 and 2. These inputs accept frame pulses in a clock format (50% duty cycle) or a basic frame pulse format with minimum pulse width of 5 ns. These pins are internally pulled down to V _{ss} . |
| Output Clocks and Frame Pulses | | | |
| D8 | sdh_clk | O | SONET/SDH Output Clock (LVCMOS). This output can be configured to provide any one of the SONET/SDH clock outputs up to 77.76 MHz. The default frequency for this output is 77.76 MHz. |
| D7 | sdh_fp | O | SONET/SDH Output Frame Pulse (LVCMOS). This output can be configured to provide virtually any style of output frame pulse synchronized with an associated SONET/SDH family output clock. The default frequency for this frame pulse output is 8 kHz. |
| G8 | p_clk | O | Programmable Output Clock (LVCMOS). This output can be configured to provide any frequency with a multiple of 8 kHz up to 77.76 MHz in addition to 2 kHz. The default frequency for this output is 2.048 MHz. |
| G7 | p_fp | O | Programmable Output Frame Pulse (LVCMOS). This output can be configured to provide virtually any style of output frame pulse associated with p_clk. The default frequency for this frame pulse output is 8 kHz. |
| A7 B8 | diff_clk_p diff_clk_n | O | Differential Output Clock (LVPECL). This output can be configured to provide any one of the available SDH clock frequencies. The default frequency for this clock output is 622.08 MHz. |
| Control | | | |
| G5 | rst_b | I | Reset (LVCMOS, Schmitt Trigger). A logic low at this input resets the device. To ensure proper operation, the device must be reset after power-up. Reset should be asserted for a minimum of 300 ns. |
| B2 | dpll_mod_sel | I _u | DPLL Mode Select (LVCMOS, Schmitt Trigger). During reset, the level on this pin determines the default mode of operation of the DPLL (Normal or Freerun). After reset, the mode of operation can be controlled directly with these pins, or by accessing the <i>dpll_modesel</i> register through the serial interface. This pin is internally pulled up to V _{dd} . |
| B3 | diff_en | I _u | Differential Output Enable (LVCMOS, Schmitt Trigger). When set high, the differential LVPECL driver is enabled. When set low, the differential driver is tristated reducing power consumption. This function is also controllable through software registers. This pin is internally pulled up to V _{dd} . |

| Pin # | Name | I/O Type | Description |
|-------------------------|---------------|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Status | | | |
| E1 | dpll_lock | O | Lock Indicator (LVCMOS). This is the lock indicator pin for the DPLL. This output goes high when the DPLL's output is frequency and phase locked to the input reference. |
| H1 | dpll_holdover | O | Holdover Indicator (LVCMOS). This pin goes high when the DPLL enters the holdover mode. |
| Serial Interface | | | |
| C1 | sck | I | Clock for Serial Interface (LVCMOS). Serial interface clock. |
| D2 | si | I | Serial Interface Input (LVCMOS). Serial interface data input pin. |
| D1 | so | O | Serial Interface Output (LVCMOS). Serial interface data output pin. |
| C2 | cs_b | I _u | Chip Select for Serial Interface (LVCMOS). Serial interface chip select. This pin is internally pulled up to V _{dd} . |
| E2 | int_b | O | Interrupt Pin (LVCMOS). Indicates a change of device status prompting the processor to read the enabled interrupt service registers (ISR). This pin is an open drain, active low and requires an external pulled up to V _{DD} . |
| APLL Loop Filter | | | |
| A5 | sdh_filter | A | External Analog PLL Loop Filter terminal. |
| B5 | filter_ref0 | A | Analog PLL External Loop Filter Reference. |
| C5 | filter_ref1 | A | Analog PLL External Loop Filter Reference. |
| JTAG and Test | | | |
| G4 | tdo | O | Test Serial Data Out (Output). JTAG serial data is output on this pin on the falling edge of tck. This pin is held in high impedance state when JTAG scan is not enabled. |
| G2 | tdi | I _u | Test Serial Data In (Input). JTAG serial test instructions and data are shifted in on this pin. This pin is internally pulled up to V _{dd} . If this pin is not used then it should be left unconnected. |
| G3 | trst_b | I _u | Test Reset (LVCMOS). Asynchronously initializes the JTAG TAP controller by putting it in the Test-Logic-Reset state. This pin should be pulsed low on power-up to ensure that the device is in the normal functional state. This pin is internally pulled up to V _{dd} . If this pin is not used then it should be connected to GND. |
| H3 | tck | I | Test Clock (LVCMOS): Provides the clock to the JTAG test logic. If this pin is not used then it should be pulled down to GND. |
| F2 | tms | I _u | Test Mode Select (LVCMOS). JTAG signal that controls the state transitions of the TAP controller. This pin is internally pulled up to V _{DD} . If this pin is not used then it should be left unconnected. |
| Master Clock | | | |
| H4 | osci | I | Oscillator Master Clock Input (LVCMOS). This input accepts a 20 MHz reference from a clock oscillator (XO, XTAL). The stability and accuracy of the clock at this input determines the free-run accuracy and the long term holdover stability of the output clocks. |

| Pin # | Name | I/O Type | Description |
|----------------------------------------------------------|--------------------|------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| H5 | osco | O | Oscillator Master Clock Output (LVCMOS). This pin must be left unconnected when the osci pin is connected to a clock oscillator. |
| Miscellaneous | | | |
| F5 | IC | | Internal Connection. Leave unconnected. |
| H6 | IC | | Internal Connection. Connect to ground. |

1.0 Functional Description

The ZL30117 SONET/SDH Line Card Synchronizer is a highly integrated device that provides timing and synchronization for network interface cards. The DPLL is capable of locking to one of three input references and provides a wide variety of synchronized output clocks and frame pulses.

1.1 DPLL Features

The Digital Phase-Locked Loop synchronizes to one of the qualified references and provides automatic or manual hitless reference switching and a holdover function when no qualified references are available. It provides a highly configurable set of features which are configurable through the serial interface. A summary of these features are shown in Table 1.

| Feature | DPLL |
|------------------------------------------|-----------------------------------------------------------------------------------|
| Modes of Operation | Free-run, Normal (locked), Holdover |
| Loop Bandwidth | User selectable: 14 Hz, 28 Hz, or wideband ¹ (890 Hz / 56 Hz / 14 Hz) |
| Phase Slope Limiting | User selectable: 885 ns/s, 7.5 μ s/s, 61 μ s/s, or unlimited |
| Pull-in Range | Fixed: 130 ppm |
| Reference Inputs | Ref0, Ref1, Ref2 |
| Sync Inputs | Sync0, Sync1, Sync2 |
| Input Reference Frequencies | 2 kHz, N * 8 kHz up to 77.76 MHz |
| Supported Sync Input Frequencies | 166.67 Hz, 400 Hz, 1 kHz, 2 kHz, 8 kHz, 64 kHz. |
| Input Reference Selection/Switching | Automatic (based on programmable priority and revertiveness), or manual selection |
| Hitless Reference Switching | Can be enabled or disabled |
| Output Clocks | diff_p/n, sdh_clk, p_clk |
| Output Frame Pulses | sdh_fp, p_fp synchronized to active sync reference. |
| Supported Output Clock Frequencies | As listed in Table 4 |
| Supported Output Frame Pulse Frequencies | As listed in Table 4 |
| External Pins Status Indicators | Lock, Holdover |

Table 1 - DPLL Features

1. In the wideband mode, the loop bandwidth depends on the frequency of the reference input. For reference frequencies equal to or greater than 64 kHz, the loop bandwidth = 890 Hz. For reference frequencies equal to or greater than 8 kHz and less than 64 kHz, the loop bandwidth = 56 Hz. For reference frequencies equal to 2 kHz, the loop bandwidth is equal to 14 Hz.

1.2 DPLL Mode Of Operation

The DPLL supports three modes of operation - free-run, normal, and holdover. The mode of operation can be manually set or controlled by an automatic state machine as shown in Figure 2.

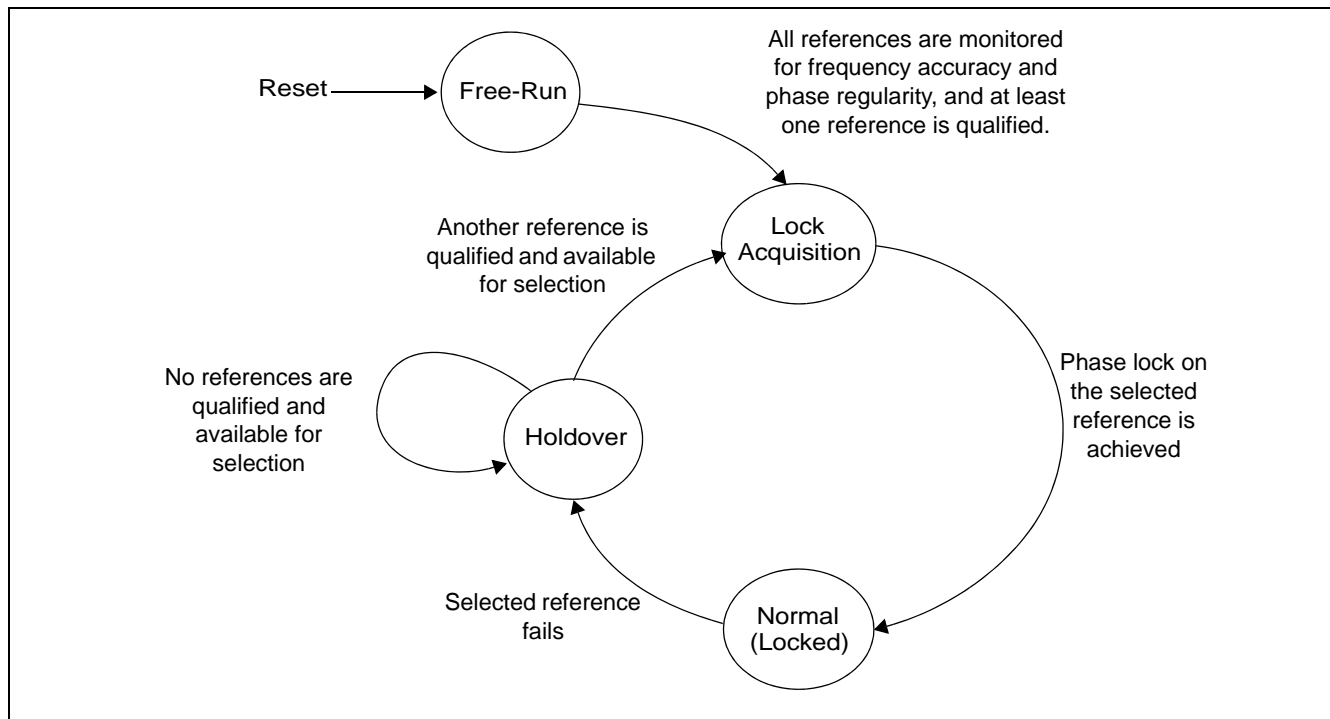

Figure 2 - Automatic Mode State Machine

Free-run

The free-run mode occurs immediately after a reset cycle or when the DPLL has never been synchronized to a reference input. In this mode, the frequency accuracy of the output clocks is equal to the frequency accuracy of the external master oscillator.

Lock Acquisition

The input references are continuously monitored for frequency accuracy and phase regularity. If at least one of the input references is qualified by the reference monitors, then the DPLL will begin lock acquisition on that input. Given a stable reference input, the ZL30117 will enter in the Normal (locked) mode.

Normal (locked)

The usual mode of operation for the DPLL is the normal mode where the DPLL phase locks to a selected qualified reference input and generates output clocks and frame pulses with a frequency accuracy equal to the frequency accuracy of the reference input. While in the normal mode, the DPLL's clock and frame pulse outputs comply with the MTIE and TDEV wander generation specifications as described in Telcordia and ITU-T telecommunication standards.

Holdover

When the DPLL operating in the normal mode loses its reference input, and no other qualified references are available, it will enter the holdover mode and continue to generate output clocks based on historical frequency data collected while the DPLL was synchronized. The transition between normal and holdover modes is controlled by the DPLL so that its initial frequency offset is better than 100 ppb. The frequency drift after this transition period is dependant on the frequency drift of the external master oscillator.

1.3 Ref and Sync Inputs

There are three reference clock inputs (**ref0** to **ref2**) available to the DPLL. Reference selection can be controlled using a built-in state machine or set in a manual mode. The selected reference input is used to synchronize the output clocks.

Figure 3 - Reference and Sync Inputs

In addition to the reference inputs, the DPLL has three optional frame pulse synchronization inputs (**sync0** to **sync2**) used to align the output frame pulses. The $sync_n$ input is selected with its corresponding ref_n input, where $n = 0, 1, \text{ or } 2$. Note that the sync input cannot be used to synchronize the DPLL, it only determines the alignment of the frame pulse outputs. An example of output frame pulse alignment is shown in Figure 4.

Figure 4 - Output Frame Pulse Alignment

Each of the **ref** inputs accept a single-ended LVCMOS clock with a frequency ranging from 2 kHz to 77.76 MHz. Built-in frequency detection circuitry automatically determines the frequency of the reference if its frequency is within the set of pre-defined frequencies as shown in Table 2. Custom frequencies definable in multiples of 8 kHz are also available.

| |
|------------|
| 2 kHz |
| 8 kHz |
| 64 kHz |
| 1.544 MHz |
| 2.048 MHz |
| 6.48 MHz |
| 8.192 MHz |
| 16.384 MHz |
| 19.44 MHz |
| 38.88 MHz |
| 77.76 MHz |

Table 2 - Set of Pre-Defined Auto-Detect Clock Frequencies

Each of the **sync** inputs accept a single-ended LVCMOS frame pulse. Since alignment is determined from the rising edge of the frame pulse, there is no duty cycle restriction on this input, but there is a minimum pulse width requirement of 5 ns. Frequency detection for the sync inputs is automatic for the supported frame pulse frequencies shown in Table 3.

| |
|---------------------------------------|
| 166.67 Hz (48x 125 μ s frames) |
| 400 Hz |
| 1 kHz |
| 2 kHz |
| 8 kHz |
| 64 kHz |

Table 3 - Set of Pre-Defined Auto-Detect Sync Frequencies

1.4 Ref and Sync Monitoring

All input references (**ref0** to **ref2**) are monitored for frequency accuracy and phase regularity. New references are qualified before they can be selected as a synchronization source, and qualified references are continuously monitored to ensure that they are suitable for synchronization. The process of qualifying a reference depends on four levels of monitoring.

Single Cycle Monitor (SCM)

The SCM block measures the period of each reference clock cycle to detect phase irregularities or a missing clock edge. In general, if the measured period deviates by more than 50% from the nominal period, then an SCM failure (**scm_fail**) is declared.

Coarse Frequency Monitor (CFM)

The CFM block monitors the reference frequency over a measurement period of 30 μs so that it can quickly detect large changes in frequency. A CFM failure (cfm_fail) is triggered when the frequency has changed by more than 3% or approximately 30000 ppm.

Precise Frequency Monitor (PFM)

The PFM block measures the frequency accuracy of the reference over a 10 second interval. To ensure an accurate frequency measurement, the PFM measurement interval is re-initiated if phase or frequency irregularities are detected by the SCM or CFM. The PFM provides a level of hysteresis between the acceptance range and the rejection range to prevent a failure indication from toggling between valid and invalid for references that are on the edge of the acceptance range.

When determining the frequency accuracy of the reference input, the PFM uses the external oscillator's output frequency (f_{ocsi}) as its point of reference.

Guard Soak Timer (GST)

The GST block mimics the operation of an analog integrator by accumulating failure events from the CFM and the SCM blocks and applying a selectable rate of decay when no failures are detected.

As shown in Figure 5, a GST failure (gst_fail) is triggered when the accumulated failures have reached the upper threshold during the disqualification observation window. When there are no CFM or SCM failures, the accumulator decrements until it reaches its lower threshold during the qualification window.

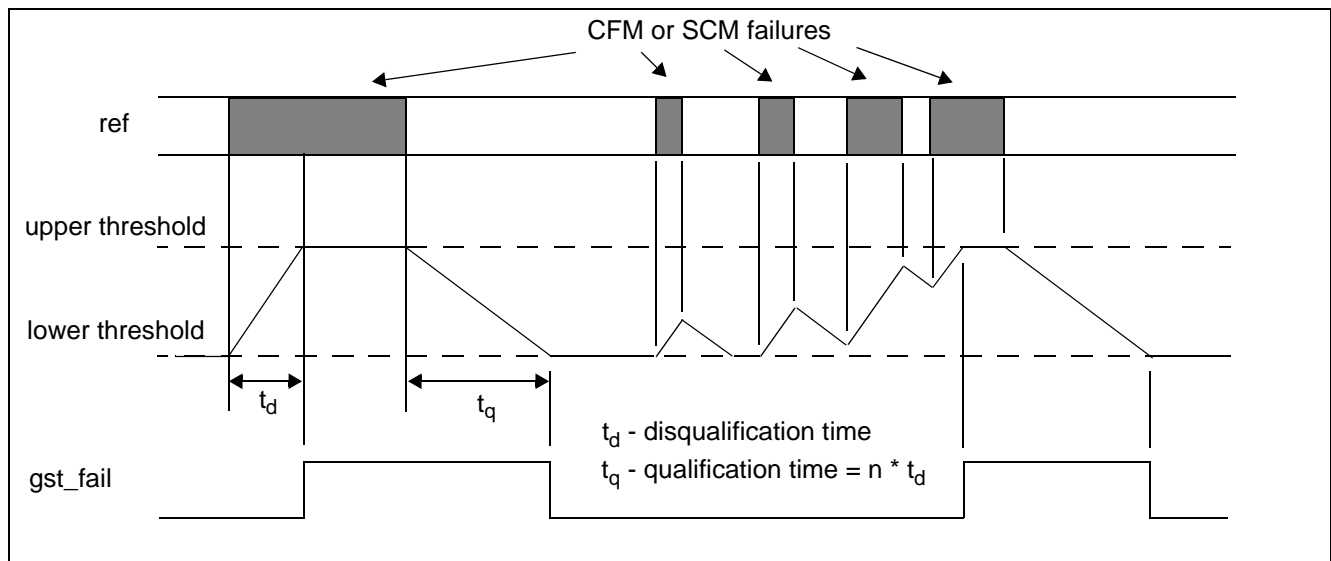

Figure 5 - Behaviour of the Guard Soak Timer during CFM or SCM Failures

Sync Ratio Monitor

All sync inputs (**sync0 to sync2**) are continuously monitored to ensure that there is a correct number of reference clock cycles within the frame pulse period.

1.5 Output Clocks and Frame Pulses

The ZL30117 offers a wide variety of outputs including one low-jitter differential LVPECL clock (**diff_clk_p/n**), one SONET/SDH LVCMOS (**sdh_clk**) output clock and one programmable LVCMOS (**p_clk**) output clock. In addition to the clock outputs, one LVCMOS SONET/SDH frame pulse output (**sdh_fp**) and one LVCMOS programmable frame pulse (**p_fp**) is also available.

Figure 6 - Output Configuration

The supported frequencies for the output clocks and frame pulses are shown in Table 4.

| diff_clk_p/n (LVPECL) | sdh_clk (LVCMOS) | p_clk (LVCMOS) | sdh_fp, p_fp (LVCMOS) |
|--------------------------|---------------------|-----------------------------|---------------------------------------|
| 6.48 MHz | 6.48 MHz | 2 kHz | 166.67 Hz (48x 125 μ s frames) |
| 19.44 MHz | 9.72 MHz | N * 8 kHz (up to 77.76 MHz) | 400 Hz |
| 38.88 MHz | 12.96 MHz | | 1 kHz |
| 51.84 MHz | 19.44 MHz | | 2 kHz |
| 77.76 MHz | 25.92 MHz | | 4 kHz |
| 155.52 MHz | 38.88 MHz | | 8 kHz |
| 311.04 MHz | 51.84 MHz | | 32 kHz |
| 622.08 MHz | 77.76 MHz | | 64 kHz |

Table 4 - Output Clock and Frame Pulse Frequencies

1.6 Configurable Input-to-Output and Output-to-Output Delays

The ZL30117 allows programmable static delay compensation for controlling input-to-output and output-to-output delays of its clocks and frame pulses.

Both the SONET/SDH APLL and the Programmable Synthesizer can be configured to lead or lag the selected input reference clock using the **DPLL Fine Delay**. The delay is programmed in steps of 119.2 ps with a range of -128 to +127 steps giving a total delay adjustment in the range of -15.26 ns to +15.14 ns. Negative values delay the output clock, positive values advance the output clock.

In addition to the delay introduced by the DPLL Fine Delay, the SONET/SDH APLL and programmable synthesizer have the ability to add their own fine delay adjustments using the **P Fine Delay** and **SDH Fine Delay**. These delays are also programmable in steps of 119.2 ps with a range of -128 to +127 steps.

In addition to these delays, the single-ended output clocks of the SONET/SDH and Programmable synthesizers can be independently offset by 90, 180 and 270 degrees using the **Coarse Delay**, and the SONET/SDH differential outputs can be independently delayed by -1.6 ns, 0 ns, +1.6 ns or +3.2 ns using the **Diff Delay**. The output frame pulses (sdh_clk, p_fp) can be independently offset with respect to each other using the **FP Delay**.

Figure 7 - Phase Delay Adjustments

2.0 Software Configuration

The ZL30117 is mainly controlled by accessing software registers through the serial peripheral interface (SPI). The device can be configured to operate in a highly automated manner which minimizes its interaction with the system's processor, or it can operate in a manual mode where the system processor controls most of the operation of the device.

The following table provides a summary of the registers available for status updates and configuration of the device.

| Addr (Hex) | Register Name | Reset Value (Hex) | Description | Type |
|--------------------------------|---------------------|-------------------|-----------------------------------------------------------------------|--------|
| Miscellaneous Registers | | | | |
| 00 | id_reg | A1 | Chip and version identification and reset ready indication register | R |
| 01 | use_hw_ctrl | 00 | Allows some functions of the device to be controlled by hardware pins | R/W |
| Interrupts | | | | |
| 02 | ref_fail_isr | FF | Reference failure interrupt service register | R |
| 03 | dpll_isr | 70 | DPLL interrupt service register | StickR |
| 04 | Reserved | | Leave as default | |
| 05 | ref_mon_fail_0 | FF | Ref0 and ref1 failure indications | StickR |
| 06 | ref_mon_fail_1 | FF | Ref2 failure indication. | StickR |
| 07 | Reserved | | Leave as default | |
| 08 | Reserved | | Leave as default | |
| 09 | ref_fail_isr_mask | 00 | Reference failure interrupt service register mask | R/W |
| 0A | dpll_isr_mask | 00 | DPLL interrupt service register mask | R/W |
| 0B | Reserved | | Leave as default | |
| 0C | ref_mon_fail_mask_0 | FF | Control register to mask each failure indicator for ref0 and ref1 | R/W |

| 54 | Reserved | | Leave as default | |
| 55 | sdh_offset_fine | 00 | Control register for the output/output phase alignment fine tuning for sdh path | R/W |
| 56 | sdh_fp_freq | 05 | Control register to select the sdh_fp frame pulse frequency | R/W |
| 57 | sdh_fp_type | 23 | Control register to select sdh_fp type | R/W |
| 58 | sdh_fp_offset_0 | 00 | Bits [7:0] of the programmable frame pulse phase offset in multiples of 1/311.04 MHz | R/W |
| 59 | sdh_fp_offset_1 | 00 | Bits [15:8] of the programmable frame pulse phase offset in multiples of 1/311.04 MHz | R/W |
| 5A | sdh_fp_offset_2 | 00 | Bits [21:16] of the programmable frame pulse phase offset in multiples of 8 kHz cycles | R/W |
| 5B - 5F | Reserved | | Leave as default | |
| Differential Output Configuration | | | | |
| 60 | diff_clk_ctrl | A3 | Control register to enable diff_clk | R/W |
| 61 | diff_clk_sel | 53 | Control register to select the diff_clk frequency | R/W |
| External Feedback Configuration | | | | |
| 62 | Reserved | | Leave as default | |
| 63 | fb_offset_fine | F5 | Control register for the output/output phase alignment fine tuning | R/W |
| 64 | reserved | | | |
| Custom Input Frequencies | | | | |
| 65 | ref_freq_mode_0 | 00 | Control register to set whether to use auto detect, CustomA or CustomB for ref0 to ref2 | R/W |
| 66 | Reserved | | Leave as default | |
| 67 | custA_mult_0 | 00 | Control register for the [7:0] bits of the custom configuration A. This is the N integer for the N*8kHz reference monitoring. | R/W |
| 68 | custA_mult_1 | 00 | Control register for the [13:8] bits of the custom configuration A. This is the N integer for the N*8kHz reference monitoring. | R/W |
| 69 | custA_scm_low | 00 | Control register for the custom configuration A: single cycle SCM low limiter | R/W |
| 6A | custA_scm_high | 00 | Control register for the custom configuration A: single cycle SCM high limiter | R/W |
| 6B | custA_cfm_low_0 | 00 | Control register for the custom configuration A: The [7:0] bits of the single cycle CFM low limit | R/W |

Table 5 - Register Map (continued)

| Addr (Hex) | Register Name | Reset Value (Hex) | Description | Type |
|------------|-----------------|-------------------|----------------------------------------------------------------------------------------------------------------------------------|------|
| 6C | custA_cfm_low_1 | 00 | Control register for the custom configuration A: The [15:0] bits of the single cycle CFM low limit | R/W |
| 6D | custA_cfm_hi_0 | 00 | Control register for the custom configuration A: The [7:0] bits of the single cycle CFM high limit | R/W |
| 6E | custA_cfm_hi_1 | 00 | Control register for the custom configuration A: The [15:0] bits of the single cycle CFM high limiter | R/W |
| 6F | custA_cfm_cycle | 00 | Control register for the custom configuration A: CFM reference monitoring cycles - 1 | R/W |
| 70 | custA_div | 00 | Control register for the custom configuration A: enable the use of ref_div4 for the CFM and PFM inputs | R/W |
| 71 | custB_mult_0 | 00 | Control register for the [7:0] bits of the custom configuration B. This is the 8 k integer for the N*8kHz reference monitoring. | R/W |
| 72 | custB_mult_1 | 00 | Control register for the [13:8] bits of the custom configuration B. This is the 8 k integer for the N*8kHz reference monitoring. | R/W |
| 73 | custB_scm_low | 00 | Control register for the custom configuration B: single cycle SCM low limiter | R/W |
| 74 | custB_scm_high | 00 | Control register for the custom configuration B: single cycle SCM high limiter | R/W |
| 75 | custB_cfm_low_0 | 00 | Control register for the custom configuration B: The [7:0] bits of the single cycle CFM low limiter. | R/W |
| 76 | custB_cfm_low_1 | 00 | Control register for the custom configuration B: The [15:0] bits of the single cycle CFM low limiter. | R/W |
| 77 | custB_cfm_hi_0 | 00 | Control register for the custom configuration B: The [7:0] bits of the single cycle CFM high limiter. | R/W |
| 78 | custB_cfm_hi_1 | 00 | Control register for the custom configuration B: The [15:0] bits of the single cycle CFM high limiter. | R/W |
| 79 | custB_cfm_cycle | 00 | Control register for the custom configuration B: CFM reference monitoring cycles - 1 | R/W |
| 7A | custB_div | 00 | Control register for the custom configuration B: enable the use of ref_div4 for the CFM and PFM inputs | R/W |

SIDE VIEW

6. PRIMARY DATUM C AND SEATING PLANE ARE DEFINED BY THE SPHERICAL CROWNS OF THE SOLDER BALLS.
 5. DIMENSION b IS MEASURED AT THE MAXIMUM SOLDER BALL DIAMETER, PARALLEL TO PRIMARY DATUM C.

BOTTOM VIEW
64 SOLDER BALLS

1. THE MAXIMUM ALLOWABLE NUMBER OF SOLDER BALLS IS 64.
 2. Not to Scale.
 3. THE BASIC SOLDER BALL GRID PITCH IS 1.00mm.
 4. ALL DIMENSIONS AND TOLERANCES CONFORM TO ASME Y14.5M-1994.
