## 10BASE-T/100BASE-TX Physical Layer Transceiver

---

---

### Highlights

- Single-Chip Ethernet Physical Layer Transceiver (PHY)
- HP Auto-MDIX Support

### Target Applications

- Printer
- LOM
- Game Console
- IPTV
- IP Phone
- IP Set-Top Box

### Key Benefits

- Single-Chip 10BASE-T/100BASE-TX Physical Layer Solution
- Fully Compliant To IEEE 802.3u Standard
- Low Power CMOS Design, Power Consumption of <180 mW
- HP Auto MDI/MDI-X For Reliable Detection and Correction for Straight-Through and Crossover Cables with Disable and Enable Option
- Robust Operation Over Standard Cables
- Power Down and Power Saving Modes
- MII Interface Support (KSZ8041NL Only)
- RMII Interface Support with External 50-MHz System Clock (KSZ8041NL Only)
- RMII Interface Support with 25-MHz Crystal/Clock Input and 50-MHz Reference Clock Output to MAC (KSZ8041RNL Only)
- MIIM (MDC/MDIO) Management Bus to 6.25 MHz for Rapid PHY Register Configuration
- Interrupt Pin Option
- Programmable LED Outputs for Link, Activity and Speed
- ESD Rating (6 kV)
- Single Power Supply (3.3V)
- Built-in 1.8V Regulator for Core
- Available In 32-pin 5 mm × 5 mm QFN Package

## TO OUR VALUED CUSTOMERS

It is our intention to provide our valued customers with the best documentation possible to ensure successful use of your Microchip products. To this end, we will continue to improve our publications to better suit your needs. Our publications will be refined and enhanced as new volumes and updates are introduced.

If you have any questions or comments regarding this publication, please contact the Marketing Communications Department via E-mail at [docerrors@microchip.com](mailto:docerrors@microchip.com). We welcome your feedback.

### Most Current Data Sheet

To obtain the most up-to-date version of this data sheet, please register at our Worldwide Web site at:

<http://www.microchip.com>

You can determine the version of a data sheet by examining its literature number found on the bottom outside corner of any page. The last character of the literature number is the version number, (e.g., DS30000000A is version A of document DS30000000).

### Errata

An errata sheet, describing minor operational differences from the data sheet and recommended workarounds, may exist for current devices. As device/documentation issues become known to us, we will publish an errata sheet. The errata will specify the revision of silicon and revision of document to which it applies.

To determine if an errata sheet exists for a particular device, please check with one of the following:

- Microchip's Worldwide Web site; <http://www.microchip.com>
- Your local Microchip sales office (see last page)

When contacting a sales office, please specify which device, revision of silicon and data sheet (include -literature number) you are using.

### Customer Notification System

Register on our web site at [www.microchip.com](http://www.microchip.com) to receive the most current information on all of our products.

# KSZ8041NL/RNL

## 1.0 GENERAL DESCRIPTION

The KSZ8041NL is a single supply 10BASE-T/100BASE-TX physical layer transceiver, which provides MII/RMII interfaces to transmit and receive data. A unique mixed-signal design extends signaling distance while reducing power consumption.

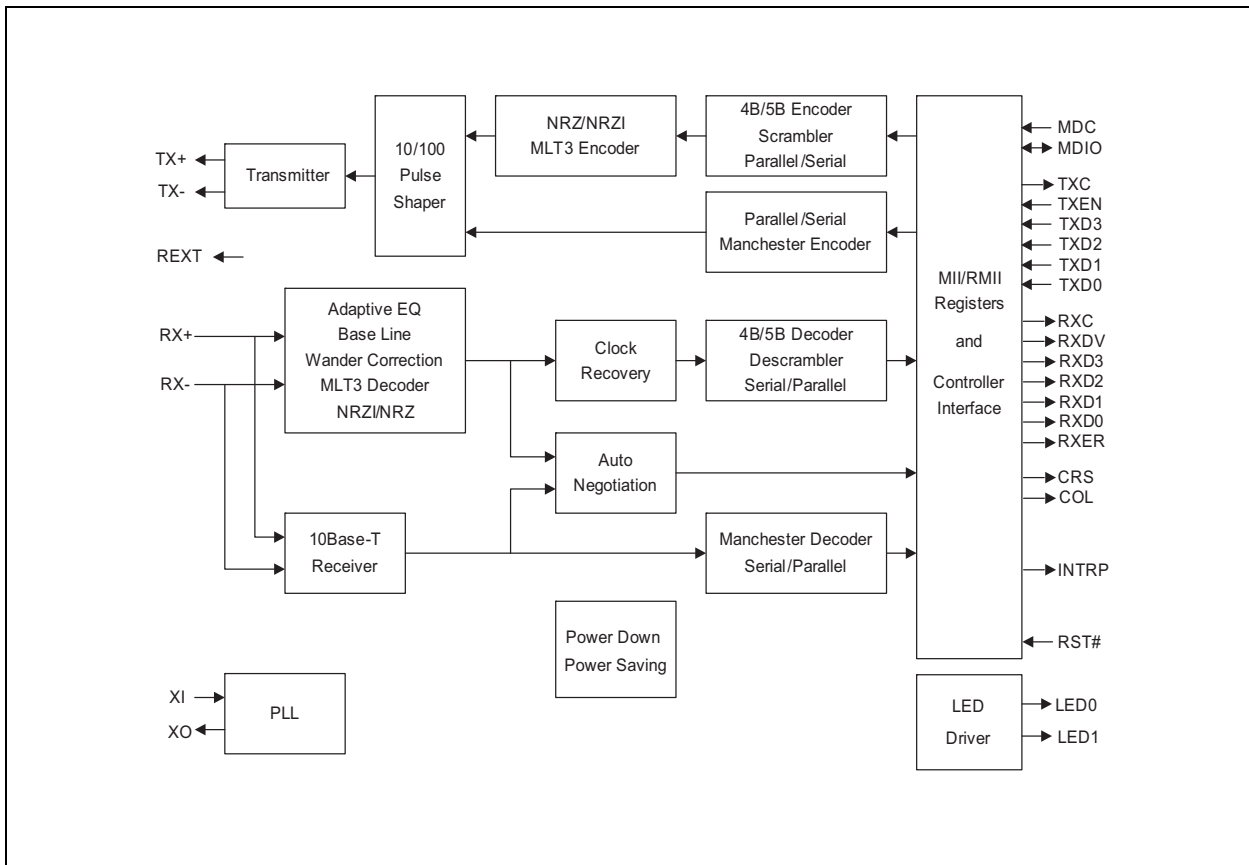

HP Auto MDI/MDI-X provides the most robust solution for eliminating the need to differentiate between crossover and straight-through cables.

The KSZ8041NL represents a new level of features and performance and is an ideal choice of physical layer transceiver for 10BASE-T/100BASE-TX applications.

The KSZ8041RNL is an enhanced Reduced Media Independent Interface (RMII) version of the KSZ8041NL that does not require a 50-MHz system clock. It uses a 25-MHz crystal for its input reference clock and outputs a 50-MHz RMII reference clock to the media access control (MAC).

The KSZ8041NL and KSZ8041RNL are available in 32-pin, lead-free QFN packages (see [Product Identification System](#)).

## 2.0 PIN DESCRIPTION AND CONFIGURATION

### 2.1 KSZ8041NL Pin Description and Configuration

FIGURE 2-1: KSZ8041NL 32-QFN PIN ASSIGNMENT (TOP VIEW)

TABLE 2-1: KSZ8041NL PIN DESCRIPTION

Pin Number	Symbol	Buffer Type (Note 2-1)	Description
1	GND	Gnd	Ground
2	VDDPLL_1.8	P	1.8V Analog $V_{DD}$ Decouple with 1.0- $\mu$ F and 0.1- $\mu$ F capacitors to ground.
3	VDDA_3.3	P	3.3V Analog $V_{DD}$
4	RX-	I/O	Physical receive or transmit signal (- differential)
5	RX+	I/O	Physical receive or transmit signal (+ differential)
6	TX-	I/O	Physical transmit or receive signal (- differential)

**TABLE 2-1: KSZ8041NL PIN DESCRIPTION (CONTINUED)**

Pin Number	Symbol	Buffer Type (Note 2-1)	Description
7	TX+	I/O	Physical transmit or receive signal (+ differential)
8	XO	O	Crystal Feedback. This pin is used only in MII mode when a 25-MHz crystal is used. This pin is a no connect if an oscillator or an external clock source is used, or if RMI mode is selected.
9	XI / REFCLK	I	Crystal/Oscillator/External Clock Input: MII mode: 25 MHz $\pm$ 50 ppm (crystal, oscillator, or external clock) RMII mode: 50 MHz $\pm$ 50 ppm (oscillator or external clock only)
10	REXT	I/O	Set physical transmit output current. Connect a 6.49-K $\Omega$ resistor in parallel with a 100-pF capacitor to ground on this pin.
11	MDIO	I/O	Management Interface (MI) Data I/O This pin requires an external 4.7-K $\Omega$ pull-up resistor.
12	MDC	I	Management Interface (MI) Clock Input This pin is synchronous to the MDIO data interface.
13	RXD3 / PHYAD0	Ipu/O	MII mode: Receive Data Output[3] (Note 2-2) Config mode: The pull-up/pull-down value is latched as PHY-ADDR[0] during power-up or reset. See “Strap-In option – KSZ8041NL” for details.
14	RXD2 / PHYAD1	Ipd/O	MII mode: Receive Data Output[2] (Note 2-2) Config mode: The pull-up/pull-down value is latched as PHY-ADDR[1] during power-up or reset. See “Strap-In option – KSZ8041NL” for details.
15	RXD1 / RXD[1] / PHYAD2	Ipd/O	MII mode: Receive Data Output[1] (Note 2-2) RMII mode: Receive Data Output[1] (Note 2-3) Config mode: The pull-up/pull-down value is latched as PHY-ADDR[2] during power-up or reset. See “Strap-In option – KSZ8041NL” for details.
16	RXD0 / RXD[0] / DUPLEX	Ipu/O	MII mode: Receive Data Output[0] (Note 2-2). RMII mode: Receive Data Output[0] (Note 2-3). Config mode: Latched as DUPLEX (register 0h, bit 8) during power-up or reset. See “Strap-In option – KSZ8041NL” for details.
17	VDDIO_3.3	P	3.3V Digital V <sub>DD</sub>
18	RXDV / CRSDV / CONFIG2	Ipd/O	MII mode: Receive Data Valid Output RMII mode: Carrier Sense/Receive Data Valid Output Config mode: The pull-up/pull-down value is latched as CONFIG2 during power-up or reset. See “Strap-In option – KSZ8041NL” for details.
19	RXC	O	MII mode: Receive Clock Output
20	RXER / RX_ER / ISO	Ipd/O	MII mode: Receive Error Output RMII mode: Receive Error Output Config mode: The pull-up/pull-down value is latched as ISOLATE during power-up or reset. See “Strap-In option – KSZ8041NL” for details.

# KSZ8041NL/RNL

**TABLE 2-1: KSZ8041NL PIN DESCRIPTION (CONTINUED)**

Pin Number	Symbol	Buffer Type (Note 2-1)	Description																		
31	LED1 / SPEED	Ipu/O	<p>LED Output: Programmable LED1 Output            Config mode: Latched as SPEED (register 0h, bit 13) during power-up or reset. See <a href="#">Strap-In option – KSZ8041NL</a> for details.            The LED1 pin is programmable via register 1Eh bits [15:14] and is defined as follows:</p> <p><b>LED Mode = [00]</b></p> <table border="1"> <thead> <tr> <th>Speed</th> <th>Pin State</th> <th>LED Definition</th> </tr> </thead> <tbody> <tr> <td>10BT</td> <td>H</td> <td>OFF</td> </tr> <tr> <td>100BT</td> <td>L</td> <td>ON</td> </tr> </tbody> </table> <p><b>LED Mode = [01]</b></p> <table border="1"> <thead> <tr> <th>Activity</th> <th>Pin State</th> <th>LED Definition</th> </tr> </thead> <tbody> <tr> <td>No Activity</td> <td>H</td> <td>OFF</td> </tr> <tr> <td>Activity</td> <td>Toggle</td> <td>Blinking</td> </tr> </tbody> </table> <p><b>LED Mode = [10]</b> Reserved</p> <p><b>LED Mode = [11]</b> Reserved</p>	Speed	Pin State	LED Definition	10BT	H	OFF	100BT	L	ON	Activity	Pin State	LED Definition	No Activity	H	OFF	Activity	Toggle	Blinking
Speed	Pin State	LED Definition																			
10BT	H	OFF																			
100BT	L	ON																			
Activity	Pin State	LED Definition																			
No Activity	H	OFF																			
Activity	Toggle	Blinking																			
32	RST#	I	Chip Reset (active low)																		
PADDLE	GND	Gnd	Ground																		

**Note 2-1** P = Power supply  
 Gnd = Ground  
 I = Input  
 O = Output  
 I/O = Bi-directional

Ipd = Input with internal pull-down (40K ±30%)  
 Ipu = Input with internal pull-up (40K ±30%)  
 Opu = Output with internal pull-up (40K ±30%)  
 Ipu/O = Input with internal pull-up (40K ±30%) during power-up/reset; output pin otherwise.  
 Ipd/O = Input with internal pull-down (40K ±30%) during power-up/reset; output pin otherwise.

**Note 2-2** MII Rx mode: The RXD[3:0] bits are synchronous with RXCLK. When RXDV is asserted, RXD[3:0] presents a valid data to the MAC through the MII. RXD[3:0] is invalid when RXDV is deasserted.

**Note 2-3** RMII Rx mode: The RXD[1:0] bits are synchronous with REF\_CLK. For each clock period in which CRS\_DV is asserted, two bits of recovered data are sent from the PHY.

**Note 2-4** MII Tx mode: The TXD[3:0] bits are synchronous with TXCLK. When TXEN is asserted, TXD[3:0] presents a valid data from the MAC through the MII. TXD[3..0] has no effect when TXEN is deasserted.

**Note 2-5** RMII Tx mode: The TXD[1:0] bits are synchronous with REF\_CLK. For each clock period in which TX\_EN is asserted, two bits of data are received by the PHY from the MAC.

## 2.2 STRAP-IN OPTION – KSZ8041NL

Pin strap-ins are latched during power-up or reset. In some systems, the MAC receive input pins may drive high during power-up or reset, and consequently cause the PHY strap-in pins on the MII/RMII signals to be latched high. In this case, it is recommended to add 1K pull-downs on these PHY strap-in pins to ensure the PHY does not strap in to ISOLATE mode, or is not configured with an incorrect PHY Address.

**TABLE 2-2: STRAP-IN OPTION – KSZ8041NL**

Pin Number	Pin Name	Type (Note 2-1)	Pin Function																		
15	PHYAD2	lpd/O	The PHY Address is latched at power-up or reset and is configurable to any value from 1 to 7. The default PHY Address is 00001. PHY Address bits [4:3] are always set to '00'.																		
14	PHYAD1	lpd/O																			
13	PHYAD0	lpu/O																			
18	CONFIG2	lpd/O	The CONFIG[2:0] strap-in pins are latched at power-up or reset and are defined as follows:																		
29	CONFIG1	lpd/O																			
28	CONFIG0	lpd/O	<table border="1"> <thead> <tr> <th>CONFIG[2:0]</th> <th>Mode</th> </tr> </thead> <tbody> <tr> <td>000</td> <td>MII (default)</td> </tr> <tr> <td>001</td> <td>RMII</td> </tr> <tr> <td>010</td> <td>Reserved - not used</td> </tr> <tr> <td>011</td> <td>Reserved - not used</td> </tr> <tr> <td>100</td> <td>MII 100 Mbps Preamble Restore</td> </tr> <tr> <td>101</td> <td>Reserved - not used</td> </tr> <tr> <td>110</td> <td>Reserved - not used</td> </tr> <tr> <td>111</td> <td>Reserved - not used</td> </tr> </tbody> </table>	CONFIG[2:0]	Mode	000	MII (default)	001	RMII	010	Reserved - not used	011	Reserved - not used	100	MII 100 Mbps Preamble Restore	101	Reserved - not used	110	Reserved - not used	111	Reserved - not used

lpd/O = Input with internal pull-down (40K ±30%) during power-up/reset; output pin otherwise.

## 3.0 FUNCTIONAL DESCRIPTION

The KSZ8041NL is a single 3.3V supply Fast Ethernet transceiver. It is fully compliant with the IEEE 802.3u specification.

On the media side, the KSZ8041NL supports 10BASE-T and 100BASE-TX with HP auto MDI/MDI-X for reliable detection of and correction for straight-through and crossover cables.

The KSZ8041NL offers a choice of MII or RMII data interface connection with the MAC processor. The MII management bus option gives the MAC processor complete access to the KSZ8041NL control and status registers. Additionally, an interrupt pin eliminates the need for the processor to poll for PHY status change.

Physical signal transmission and reception are enhanced through the use of patented analog circuitries that make the design more efficient and allow for lower power consumption and smaller chip die size.

The KSZ8041RNL is an enhanced RMII version of the KSZ8041NL that does not require a 50-MHz system clock. It uses a 25-MHz crystal for its input reference clock and outputs a 50-MHz RMII reference clock to the MAC.

### 3.1 100BASE-TX Transmit

The 100BASE-TX transmit function performs parallel-to-serial conversion, 4B/5B coding, scrambling, NRZ-to-NRZI conversion, and MLT3 encoding and transmission.

The circuitry starts with a parallel-to-serial conversion, which converts the MII data from the MAC into a 125-MHz serial bit stream. The data and control stream is then converted into 4B/5B coding, followed by a scrambler. The serialized data is further converted from NRZ-to-NRZI format, and then transmitted in MLT3 current output.

The output current is set by an external 6.49-k $\Omega$  1% resistor for the 1:1 transformer ratio. It has typical rise or fall times of 4 ns and complies with the ANSI TP-PMD standard regarding amplitude balance, overshoot, and timing jitter. The wave-shaped 10BASE-T output drivers are also incorporated into the 100BASE-TX drivers.

### 3.2 100BASE-TX Receive

The 100BASE-TX receiver function performs adaptive equalization, DC restoration, MLT3-to-NRZI conversion, data and clock recovery, NRZI-to-NRZ conversion, descrambling, 4B/5B decoding, and serial-to-parallel conversion.

The receiving side starts with the equalization filter to compensate for inter-symbol interference (ISI) over the twisted pair cable. Because the amplitude loss and phase distortion are functions of the cable length, the equalizer must adjust its characteristics to optimize performance. In this design, the variable equalizer makes an initial estimation based on comparisons of incoming signal strength against some known cable characteristics, and then tunes itself for optimization. This is an ongoing process and self-adjusts against environmental changes such as temperature variations.

Next, the equalized signal goes through a DC restoration and data conversion block. The DC restoration circuit is used to compensate for the effect of baseline wander and to improve the dynamic range. The differential data conversion circuit converts the MLT3 format back to NRZI. The slicing threshold is also adaptive.

The clock recovery circuit extracts the 125-MHz clock from the edges of the NRZI signal. This recovered clock is then used to convert the NRZI signal into the NRZ format. This signal is sent through the descrambler followed by the 4B/5B decoder. Finally, the NRZ serial data is converted to the MII format and provided as the input data to the MAC.

### 3.3 PLL Clock Synthesizer

The KSZ8041NL/RNL generates 125-MHz, 25-MHz, and 20-MHz clocks for system timing. Internal clocks are generated from an external 25-MHz crystal or oscillator. For the KSZ8041NL in RMII mode, these internal clocks are generated from an external 50-MHz oscillator or system clock.

### 3.4 Scrambler/Descrambler (100BASE-TX only)

The purpose of the scrambler is to spread the power spectrum of the signal to reduce EMI and baseline wander.

### 3.5 10BASE-T Transmit

The 10BASE-T drivers are incorporated with the 100BASE-TX drivers to allow for transmission using the same magnetic. The drivers also perform internal wave-shaping and pre-emphasize, and output 10BASE-T signals with a typical amplitude of 2.5V peak. The 10BASE-T signals have harmonic contents that are at least 27 dB below the fundamental frequency when driven by an all-ones Manchester-encoded signal.

# KSZ8041NL/RNL

---

## 3.6 10BASE-T Receive

On the receive side, input buffer and level detecting squelch circuits are employed. A differential input receiver circuit and a PLL performs the decoding function. The Manchester-encoded data stream is separated into clock signal and NRZ data. A squelch circuit rejects signals with levels less than 400 mV or with short pulse widths to prevent noise at the RX+ and RX- inputs from falsely triggering the decoder. When the input exceeds the squelch limit, the PLL locks onto the incoming signal and the KSZ8041NL/RNL decodes a data frame. The receive clock is kept active during idle periods in between data reception.

## 3.7 SQE and Jabber Function (10BASE-T only)

In 10BASE-T operation, a short pulse is put out on the COL pin after each frame is transmitted. This SQE Test is required as a test of the 10BASE-T transmit/receive path. If transmit enable (TXEN) is high for more than 20 ms (jabbering), the 10BASE-T transmitter is disabled and COL is asserted high. If TXEN is then driven low for more than 250 ms, the 10BASE-T transmitter is re-enabled and COL is deasserted (returns to low).

## 3.8 Auto-Negotiation

The KSZ8041NL/RNL conforms to the auto-negotiation protocol, defined in Clause 28 of the IEEE 802.3u specification. Auto-negotiation is enabled by either hardware pin strapping (pin 30) or software (register 0h bit 12).

Auto-negotiation allows unshielded twisted pair (UTP) link partners to select the highest common mode of operation. Link partners advertise their capabilities to each other, and then compare their own capabilities with those they received from their link partners. The highest speed and duplex setting that is common to the two link partners is selected as the mode of operation.

The following list shows the speed and duplex operation mode from highest to lowest:

- Priority 1: 100BASE-TX, full-duplex
- Priority 2: 100BASE-TX, half-duplex
- Priority 3: 10BASE-T, full-duplex
- Priority 4: 10BASE-T, half-duplex

If auto-negotiation is not supported or the KSZ8041NL/RNL link partner is forced to bypass auto-negotiation, the KSZ8041NL/RNL sets its operating mode by observing the signal at its receiver. This is known as parallel detection, and this allows the KSZ8041NL/RNL to establish a link by listening for a fixed signal protocol in the absence of auto-negotiation advertisement protocol.

The auto-negotiation link-up process is shown in the flow chart illustrated as [Figure 3-1](#).

**FIGURE 3-1: AUTO-NEGOTIATION FLOW CHART**

### 3.9 MII Management (MIIM) Interface

The KSZ8041NL/RNL supports the IEEE 802.3 MII Management Interface, also known as the Management Data Input or Output (MDIO) Interface. This interface allows upper-layer devices to monitor and control the state of the KSZ8041NL/RNL. An external device with MIIM capability is used to read the PHY status or to configure the PHY settings or both. Further details on the MIIM interface can be found in Clause 22.2.4 of the IEEE 802.3 specification.

The MIIM interface consists of the following:

- A physical connection that incorporates the clock line (MDC) and the data line (MDIO).
- A specific protocol that operates across the aforementioned physical connection that allows an external controller to communicate with one or more PHY devices. Each KSZ8041NL/RNL device is assigned a unique PHY address between 1 and 7 by its PHYAD[2:0] strapping pins. Additionally, every KSZ8041NL/RNL device supports the broadcast PHY address 0, as defined per the IEEE 802.3 specification, which can be used to read or write to a single KSZ8041NL/RNL device, or write to multiple KSZ8041NL/RNL devices simultaneously.
- A set of 16-bit MDIO registers. Registers [0:6] are required, and their functions are defined per the IEEE 802.3 specification. The additional registers are provided for expanded functionality.

# KSZ8041NL/RNL

Table 3-1 shows the MII Management frame format for the KSZ8041NL/RNL.

**TABLE 3-1: MII MANAGEMENT FRAME FORMAT**

	Preamble	Start of Frame	Read/Write OP Code	PHY Address Bits [4:0]	REG Address Bits [4:0]	TA	Data Bits [15:0]	Idle
Read	32 1's	01	10	00AAA	RRRRR	Z0	DDDDDDDD_DDDDDDDD	Z
Write	32 1's	01	01	00AAA	RRRRR	10	DDDDDDDD_DDDDDDDD	Z

## 3.10 Interrupt (INTRP)

INTRP (pin 21) is an optional interrupt signal that is used to inform the external controller that there has been a status update to the KSZ8041NL/RNL PHY register. Bits[15:8] of register 1Bh are the interrupt control bits and are used to enable and disable the conditions for asserting the INTRP signal. Bits[7:0] of register 1Bh are the interrupt status bits, and are used to indicate which interrupt conditions have occurred. The interrupt status bits are cleared after reading register 1Bh.

Bit 9 of register 1Fh sets the interrupt level to active high or active low.

## 3.11 MII Data Interface (KSZ8041NL only)

The Media Independent Interface (MII) is specified in Clause 22 of the IEEE 802.3 specification. It provides a common interface between physical layer and MAC layer devices, and has the following key characteristics:

- Supports 10 Mbps and 100 Mbps data rates
- Uses a 25-MHz reference clock, sourced by the PHY
- Provides independent 4-bit wide (nibble) transmit and receive data paths
- Contains two distinct groups of signals: one for transmission and the other for reception

By default, the KSZ8041NL is configured to MII mode after it is powered up or reset with the following:

- A 25-MHz crystal connected to XI, XO (pins 9, 8), or an external 25-MHz clock source (oscillator) connected to XI
- CONFIG[2:0] (pins 18, 29, 28) set to '000' (default setting)

## 3.12 MII Signal Definition (KSZ8041NL only)

Table 3-2 describes the MII signals. Refer to Clause 22 of the IEEE 802.3 specification for detailed information.

**TABLE 3-2: MII SIGNAL DEFINITION**

MII Signal Name	Direction (with respect to PHY, KSZ8041NL signal)	Direction (with respect to MAC)	Description
TXC	Output	Input	Transmit Clock (2.5 MHz for 10 Mbps, 25 MHz for 100 Mbps)
TXEN	Input	Output	Transmit Enable
TXD[3:0]	Input	Output	Transmit Data [3:0]
RXC	Output	Input	Receive Clock (2.5 MHz for 10 Mbps, 25 MHz for 100 Mbps)
RXDV	Output	Input	Receive Data Valid
RXD[3:0]	Output	Input	Receive Data [3:0]
RXER	Output	Input, or (not required)	Receive Error
CRS	Output	Input	Carrier Sense
COL	Output	Input	Collision Detection

## 3.12.1 TRANSMIT CLOCK (TXC)

TXC is sourced by the PHY. It is a continuous clock that provides the timing reference for Transmit Enable (TXEN) and Transmit Data [3:0] (TXD[3:0]).

TXC is 2.5 MHz for 10 Mbps operation and 25 MHz for 100 Mbps operation.

## 3.12.2 TRANSMIT ENABLE (TXEN)

TXEN indicates the MAC is presenting nibbles on TXD[3:0] for transmission. It is asserted synchronously with the first nibble of the preamble and remains asserted while all nibbles to be transmitted are presented on the MII, and is negated prior to the first TXC following the final nibble of a frame.

TXEN transitions synchronously with respect to TXC.

## 3.12.3 TRANSMIT DATA [3:0] (TXD[3:0])

TXD[3:0] transitions synchronously with respect to TXC. When TXEN is asserted, TXD[3:0] are accepted for transmission by the PHY. TXD[3:0] is "00" to indicate idle when TXEN is deasserted. Values other than "00" on TXD[3:0] while TXEN is deasserted are ignored by the PHY.

## 3.12.4 RECEIVE CLOCK (RXC)

RXC provides the timing reference for RXDV, RXD[3:0], and RXER.

- In 10 Mbps mode, RXC is recovered from the line while the carrier is active. RXC is derived from the PHY's reference clock when the line is idle or the link is down.
- In 100 Mbps mode, RXC is continuously recovered from the line. If the link is down, RXC is derived from the PHY's reference clock.

RXC is 2.5 MHz for 10 Mbps operation and 25 MHz for 100 Mbps operation.

## 3.12.5 RECEIVE DATA VALID (RXDV)

RXDV is driven by the PHY to indicate that the PHY is presenting recovered and decoded nibbles on RXD[3:0].

- In 10 Mbps mode, RXDV is asserted with the first nibble of the SFD (Start of Frame Delimiter), "5D", and remains asserted until the end of the frame.
- In 100 Mbps mode, RXDV is asserted from the first nibble of the preamble to the last nibble of the frame.

RXDV transitions synchronously with respect to RXC.

## 3.12.6 RECEIVE DATA [3:0] (RXD[3:0])

RXD[3:0] transitions synchronously with respect to RXC. For each clock period in which RXDV is asserted, RXD[3:0] transfers a nibble of recovered data from the PHY.

## 3.12.7 RECEIVE ERROR (RXER)

RXER is asserted for one or more RXC periods to indicate that a Symbol Error (for example, a coding error that a PHY is capable of detecting, and that may otherwise be undetectable by the MAC sub-layer) was detected somewhere in the frame presently being transferred from the PHY.

RXER transitions synchronously with respect to RXC. While RXDV is deasserted, RXER has no effect on the MAC.

## 3.12.8 CARRIER SENSE (CRS)

CRS is asserted and deasserted as follows:

- In 10 Mbps mode, CRS assertion is based on the reception of valid preambles. CRS deassertion is based on the reception of an end-of-frame (EOF) marker.
- In 100 Mbps mode, CRS is asserted when a start-of-stream delimiter, or /J/K symbol pair is detected. CRS is deasserted when an end-of-stream delimiter, or /T/R symbol pair is detected. Additionally, the PMA layer deasserts CRS if IDLE symbols are received without /T/R.

## 3.12.9 COLLISION (COL)

COL is asserted in half-duplex mode whenever the transmitter and the receiver are simultaneously active on the line. This is used to inform the MAC that a collision has occurred during its transmission to the PHY.

COL transitions asynchronously with respect to TXC and RXC.

# KSZ8041NL/RNL

## 3.13 Reduced MII (RMII) Data Interface

The Reduced Media Independent Interface (RMII) specifies a low pin count MII. It provides a common interface between physical layer and MAC layer devices, and has the following key characteristics:

- Supports 10 Mbps and 100 Mbps data rates
- Uses a 50-MHz reference clock
- Provides independent 2-bit wide (di-bit) transmit and receive data paths
- Contains two distinct groups of signals: one for transmission and the other for reception

The KSZ8041NL is configured in RMII mode after it is powered up or reset with the following:

- A 500MHz reference clock connected to REFCLK (pin 9)
- CONFIG[2:0] (pins 18, 29, 28) set to '001'

The KSZ8041RNL is configured in RMII mode and outputs the 50-MHz RMII reference clock to the MAC on REF\_CLK (pin 19) after it is powered up or reset with the following:

- A 25-MHz crystal connected to XI (pin 9) and XO (pin 8), or a 25-MHz reference clock connected to XI (pin 9)
- CONFIG[2:0] (pins 18, 29, 28) set to '001'

In RMII mode, unused MII signals, TXD[3:2] (pins 27, 26), are tied to ground.

## 3.14 RMII Signal Definition

Table 3-3 and Table 3-4 describe the RMII signals for KSZ8041NL and KSZ8041RNL. Refer to RMII specification for detailed information.

**TABLE 3-3: RMII SIGNAL DESCRIPTION – KSZ8041NL**

RMII Signal Name	Direction (with respect to PHY, KSZ8041NL signal)	Direction (with respect to MAC)	Description
REF_CLK	Input	Input or Output	Synchronous 50-MHz clock reference for receive, transmit, and control interface
TX_EN	Input	Output	Transmit Enable
TXD[1:0]	Input	Output	Transmit Data [1:0]
CRS_DV	Output	Input	Carrier Sense/Receive Data Valid
RXD[1:0]	Output	Input	Receive Data [1:0]
RX_ER	Output	Input, or (not required)	Receive Error

**TABLE 3-4: RMII SIGNAL DESCRIPTION – KSZ8041RNL**

RMII Signal Name	Direction (with respect to PHY, KSZ8041RNL signal)	Direction (with respect to MAC)	Description
REF_CLK	Output	Input	Synchronous 50-MHz clock reference for receive, transmit, and control interface
TX_EN	Input	Output	Transmit Enable
TXD[1:0]	Input	Output	Transmit Data [1:0]
CRS_DV	Output	Input	Carrier Sense/Receive Data Valid
RXD[1:0]	Output	Input	Receive Data [1:0]
RX_ER	Output	Input, or (not required)	Receive Error

### 3.14.1 REFERENCE CLOCK (REF\_CLK)

REF\_CLK is a continuous 50-MHz clock that provides the timing reference for TX\_EN, TXD[1:0], CRS\_DV, RXD[1:0], and RX\_ER.

The KSZ8041NL inputs the 50-MHz REF\_CLK from the MAC or system board.

The KSZ8041RNL generates the 50MHz RMII REF\_CLK and outputs it to the MAC.

### 3.14.2 TRANSMIT ENABLE (TX\_EN)

TX\_EN indicates that the MAC is presenting di-bits on TXD[1:0] for transmission. It is asserted synchronously with the first nibble of the preamble and remains asserted while all di-bits to be transmitted are presented on the RMII, and is negated prior to the first REF\_CLK following the final di-bit of a frame.

TX\_EN transitions synchronously with respect to REF\_CLK.

### 3.14.3 TRANSMIT DATA [1:0] (TXD[1:0])

TXD[1:0] transitions synchronously with respect to REF\_CLK. When TX\_EN is asserted, TXD[1:0] is accepted for transmission by the PHY. TXD[1:0] is "00" to indicate idle when TX\_EN is deasserted. Values other than "00" on TXD[1:0] while TX\_EN is deasserted are ignored by the PHY.

### 3.14.4 CARRIER SENSE/RECEIVE DATA VALID (CRS\_DV)

CRS\_DV is asserted by the PHY when the receive medium is non-idle. It is asserted asynchronously on detection of a carrier. This is when a squelch is passed in 10 Mbps mode, and when two non-contiguous zeros in 10 bits are detected in 100 Mbps mode. Loss of carrier results in the deassertion of CRS\_DV.

As long as carrier detection criteria are met, CRS\_DV remains asserted continuously from the first recovered di-bit of the frame through the final recovered di-bit, and it is negated prior to the first REF\_CLK that follows the final di-bit. The data on RXD[1:0] is considered valid once CRS\_DV is asserted. However, since the assertion of CRS\_DV is asynchronous relative to REF\_CLK, the data on RXD[1:0] is "00" until proper receive signal decoding takes place.

### 3.14.5 RECEIVE DATA [1:0] (RXD[1:0])

RXD[1:0] transitions synchronously to REF\_CLK. For each clock period in which CRS\_DV is asserted, RXD[1:0] transfers two bits of recovered data from the PHY. RXD[1:0] is "00" to indicate idle when CRS\_DV is deasserted. Values other than "00" on RXD[1:0] while CRS\_DV is deasserted are ignored by the MAC.

### 3.14.6 RECEIVE ERROR (RX\_ER)

RX\_ER is asserted for one or more REF\_CLK periods to indicate that a Symbol Error (for example, a coding error that a PHY is capable of detecting, and that may otherwise be undetectable by the MAC sub-layer) was detected somewhere in the frame presently being transferred from the PHY.

RX\_ER transitions synchronously with respect to REF\_CLK. While CRS\_DV is deasserted, RX\_ER has no effect on the MAC.

### 3.14.7 COLLISION DETECTION

The MAC regenerates the COL signal of the MII from TX\_EN and CRS\_DV.

# KSZ8041NL/RNL

## 3.15 RMII Signal Diagram

The KSZ8041NL RMII pin connections to the MAC are shown in Figure 3-2.

FIGURE 3-2: KSZ8041NL RMII INTERFACE

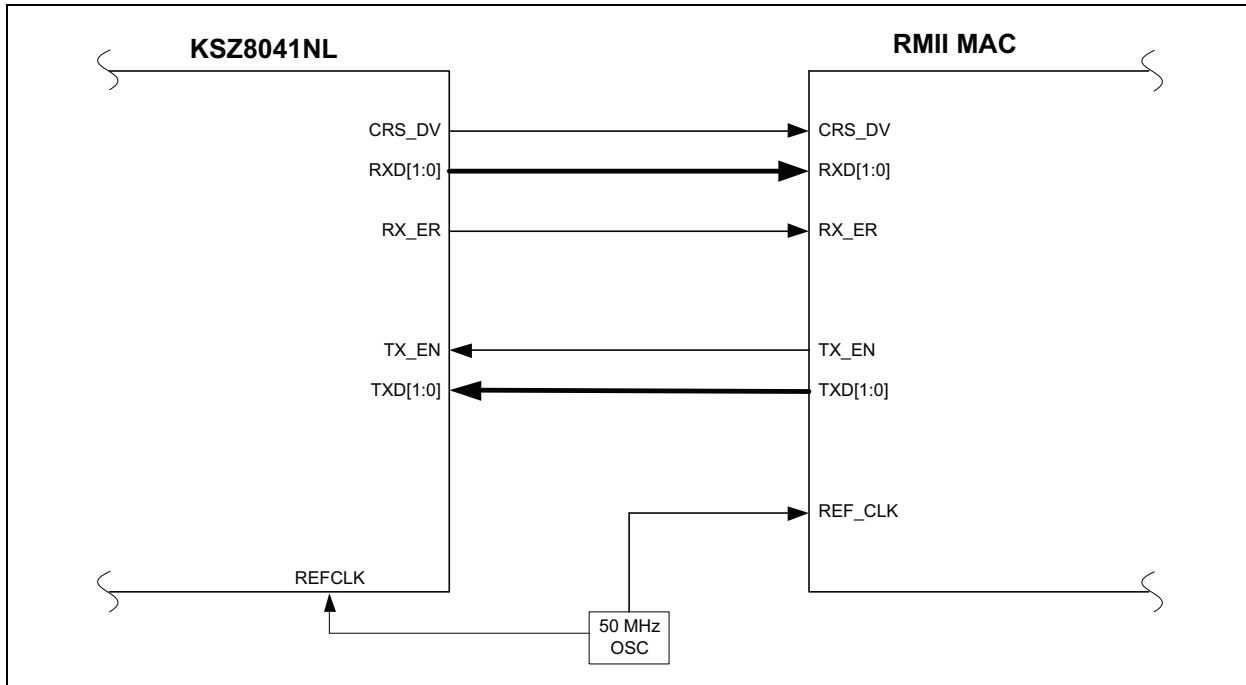

FIGURE 3-3: KSZ8041RNL RMII INTERFACE

## 3.16 HP Auto MDI/MDI-X

HP Auto MDI/MDI-X configuration eliminates the confusion of whether to use a straight cable or a crossover cable between the KSZ8041NL/RNL and its link partner. This feature allows the KSZ8041NL/RNL to use either type of cable to connect with a link partner that is in either MDI or MDI-X mode. The auto-sense function detects transmit and receive pairs from the link partner, and then assigns transmit and receive pairs of the KSZ8041NL/RNL accordingly.

HP Auto MDI/MDI-X is enabled by default. Writing “1” to register 1F bit 13 disables HP Auto MDI/MDL-X. Register 1F bit 14 selects MDI and MDI-X mode if HP Auto MDI/MDI-X is disabled.

An isolation transformer with symmetrical transmit and receive data paths is recommended to support auto MDI/MDI-X. The IEEE 802.3 Standard MDI and MDI-X is defined in [Table 3-5](#).

**TABLE 3-5: MDI/MDI-X PIN DESCRIPTION**

MDI		MDI-X	
RJ-45 Pin	Signal	RJ-45 Pin	Signal
1	TD+	1	RD+
2	TD-	2	RD-
3	RD+	3	TD+
6	RD-	6	TD-

# KSZ8041NL/RNL

## 3.16.1 STRAIGHT CABLE

A straight cable connects an MDI device to an MDI-X device, or an MDI-X device to an MDI device. Figure 3-4 depicts a typical straight cable connection between a NIC card (MDI) and a switch, or hub (MDI-X).

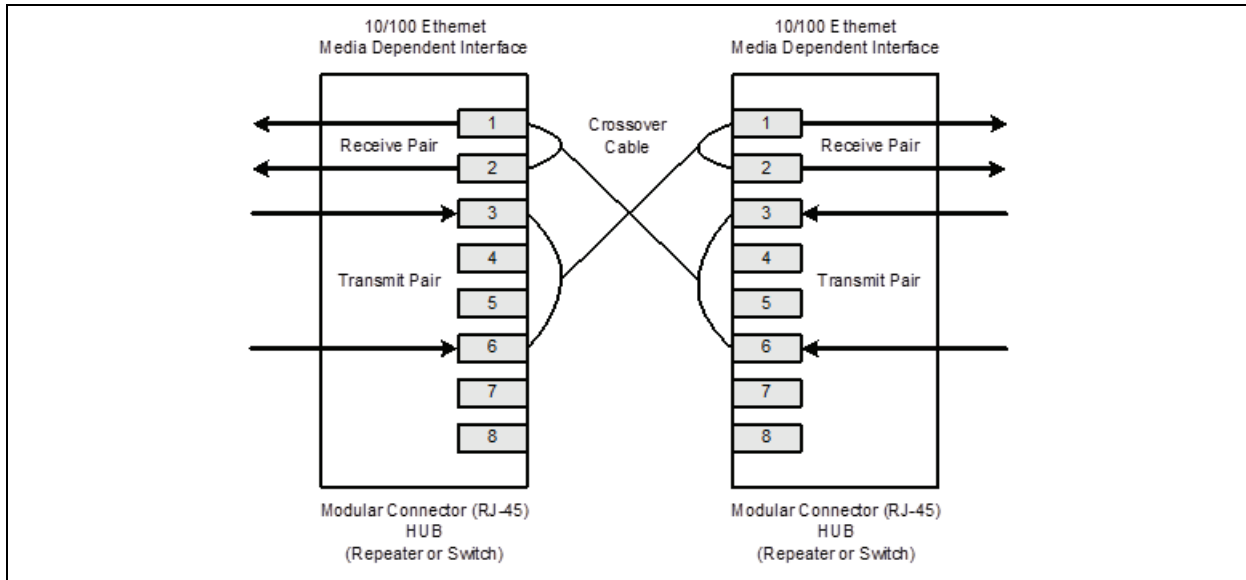

**FIGURE 3-4: TYPICAL STRAIGHT CABLE CONNECTION**

## 3.16.2 CROSSOVER CABLE

A crossover cable connects an MDI device to another MDI device, or an MDI-X device to another MDI-X device. Table 3-4 depicts a typical crossover cable connection between two switches or hubs (two MDI-X devices).

**FIGURE 3-5: TYPICAL CROSSOVER CABLE CONNECTION**

## 3.17 Power Management

The KSZ8041NL/RNL offers the following two power management modes:

- **Power Saving Mode**  
This mode is used to reduce power consumption when the cable is unplugged. It is in effect when the auto-negotiation mode is enabled, the cable is disconnected, and register 1F bit 10 is set to 1. Under the power saving mode, the KSZ8041NL/RNL shuts down all transceiver blocks, except for transmitter, energy detect, and PLL circuits. Additionally, for the KSZ8041NL in MII mode, the RXC clock output is disabled. RXC clock is enabled after the cable is connected and a link is established. Power-saving mode is disabled by writing “0” to register 1F bit 10.
- **Power-Down Mode**  
This mode is used to power down the entire KSZ8041NL/RNL device when it is not in use. Power down mode is enabled by writing “1” to register 0 bit 11. In the power down state, the KSZ8041NL/RNL disables all internal functions, except for the MII management interface.

## 3.18 Reference Clock Connection Options

A crystal or clock source, such as an oscillator, is used to provide the reference clock for the KSZ8041NL/RNL.

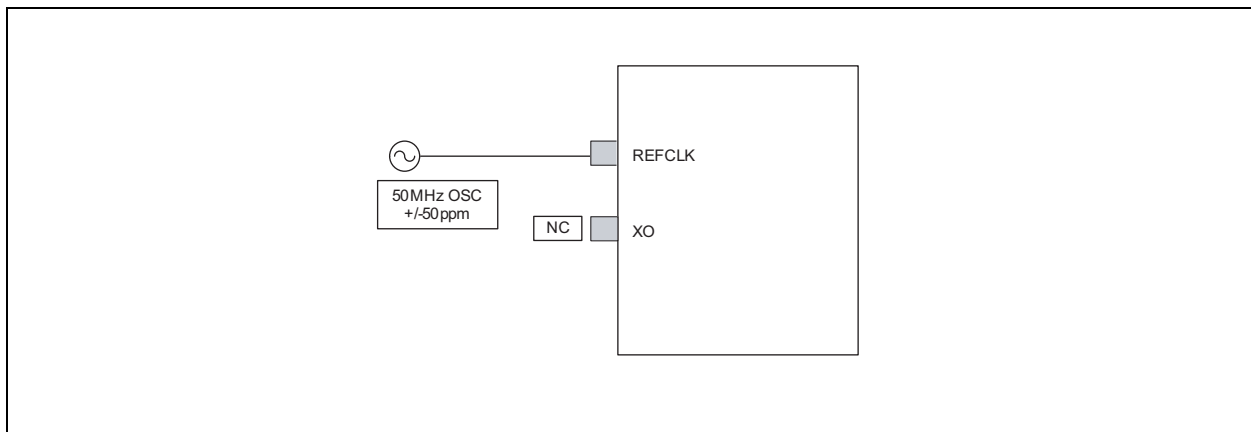

Figure 3-6 illustrates how to connect the 25-MHz crystal and oscillator reference clock.

**FIGURE 3-6: 25-MHZ CRYSTAL/OSCILLATOR REFERENCE CLOCK**

For the KSZ8041NL, Figure 3-7 illustrates how to connect the 50-MHz oscillator reference clock for RMII mode.

**FIGURE 3-7: 50-MHZ OSCILLATOR REFERENCE CLOCK FOR KSZ8041NL RMII MODE**

## 3.19 Reference Circuit for Power and Ground Connections

The KSZ8041NL/RNL is a single 3.3V supply device with a built-in 1.8V low-noise regulator. The power and ground connections are shown in Figure 3-8 and Table 3-6.

# KSZ8041NL/RNL

**FIGURE 3-8: KSZ8041NL/RNL POWER AND GROUND CONNECTIONS**

**TABLE 3-6: KSZ8041NL/RNL POWER PIN DESCRIPTION**

Power Pin	Pin Number	Description
VDDPLL_1.8	2	Decouple with 1.0 µF and 0.1 µF capacitors to ground.
VDDA_3.3	3	Connect to the board's 3.3V supply through ferrite bead.
VDDIO_3.3	17	Connect to the board's 3.3V supply.

## 4.0 REGISTERS

### 4.1 Register Map

Table 4-1 summarizes the register map.

**TABLE 4-1: REGISTER MAP**

Register Number (Hex)	Description

## 5.0 OPERATIONAL CHARACTERISTICS

### 5.1 Absolute Maximum Ratings (Note 5-1)

Supply Voltage ( $V_{DDPLL\_1.8}$ ).....	-0.5V to +2.4V
Supply Voltage ( $V_{DDPLL\_3.3}$ , $V_{DDPLL\_3.3}$ ) .....	-0.5V to +4.0V
Input Voltage (all inputs).....	-0.5V to +4.0V
Output Voltage (all outputs).....	-0.5V to +4.0V
Storage Temperature ( $T_S$ ).....	-55°C to +150°C
ESD Performance Rating (Note 5-2).....	+6 kV

### 5.2 Operating Ratings (Note 5-3)

Supply Voltage ( $V_{DDIO\_3.3}$ , $V_{DDA\_3.3}$ ).....	+3.135V to +3.465V
Ambient Temperature	
( $T_A$ , Commercial).....	0°C to +70°C
( $T_A$ , Industrial).....	-40°C to +85°C
( $T_A$ , Automotive Qualified).....	-40°C to +85°C
Maximum Junction Temperature ( $T_J$ maximum).....	+125°C
Thermal Resistance ( $\theta_{JA}$ ).....	34°C/W
Thermal Resistance ( $\theta_{JC}$ ).....	6°C/W

**Note 5-1** Exceeding the absolute maximum rating may damage the device. Stresses greater than the absolute maximum rating may cause permanent damage to the device. Operation of the device at these or any other conditions above those specified in the operating sections of this specification is not implied. Maximum conditions for extended periods may affect reliability.

**Note 5-2** Devices are ESD sensitive. Handling precautions are recommended. Human body model, 1.5 k $\Omega$  in series with 100 pF.

**Note 5-3** The device is not guaranteed to function outside its operating rating.

## 6.0 ELECTRICAL CHARACTERISTICS

**TABLE 6-1: ELECTRICAL CHARACTERISTICS (Note 6-1, Note 6-2)**

Symbol	Parameter	Condition	Min.	Typ.	Max.	Units
<b>Supply Current</b>						
$I_{DD1}$	100BASE-TX	Chip only (no transformer); Full-duplex traffic @ 100% utilization	—	53.0	—	mA
$I_{DD2}$	10BASE-T	Chip only (no transformer); Full-duplex traffic @ 100% utilization	—	38.0	—	mA
$I_{DD3}$	Power-Saving Mode	Ethernet cable disconnected (reg. 1F.10 = 1)	—	32.0	—	mA
$I_{DD4}$	Power-Down Mode	Software power-down (reg. 0.11 = 1)	—	4.0	—	mA
<b>TTL Inputs</b>						
$V_{IH}$	Input High Voltage	—	2.0	—	—	V
$V_{IL}$	Input Low Voltage	—	—	—	0.8	V
$I_{IN}$	Input Current	$V_{IN} = \text{GND} \sim \text{VDDIO}$	—	-10	10	$\mu\text{A}$
<b>TTL Outputs</b>						
$V_{OH}$	Output High Voltage	$I_{OH} = -4 \text{ mA}$	2.4	—	—	V
$V_{OL}$	Output Low Voltage	$I_{OL} = 4 \text{ mA}$	—	—	0.4	V
$ I_{OZ} $	Output Tri-State Leakage	—	—	—	10	$\mu\text{A}$
<b>LED Outputs</b>						
$I_{LED}$	Output Drive Current	Each LED pin (LED0, LED1)	—	8	—	mA
<b>100BASE-TX Transmit (measured differentially after 1:1 transformer)</b>						
$V_O$	Peak Differential Output Voltage	100 $\Omega$ termination across differential output	0.95	—	1.05	V
$V_{IMB}$	Output Voltage Imbalance	100 $\Omega$ termination across differential output	—	—	2	%
$t_r, t_f$	Rise/Fall Time	—	3	—	5	ns
	Rise/Fall Time Imbalance	—	0	—	0.5	ns
	Duty Cycle Distortion	—	—	—	$\pm 0.25$	ns
	Overshoot	—	—	—	5	%
$V_{SET}$	Reference Voltage of ISET	—	—	0.65	—	V
—	Output Jitter	Peak-to-peak	—	0.7	1.4	ns
<b>10BASE-T Transmit (measured differentially after 1:1 transformer)</b>						
$V_P$	Peak Differential Output Voltage	100 $\Omega$ termination across differential output	2.2	—	2.8	V
—	Jitter Added	Peak-to-peak	—	—	3.5	ns
$t_r, t_f$	Rise/Fall Time	—	—	25	—	ns
<b>10BASE-T Receive</b>						
$V_{SQ}$	Squelch Threshold	5 MHz square wave	—	400	—	mV

**Note 6-1** Current consumption is for the single 3.3V supply KSZ8041NL/RNL device only, and includes the 1.8V supply voltage (VDDPLL\_1.8) that is provided by the KSZ8041NL/RNL. The PHY port's transformer consumes an additional 45 mA @ 3.3V for 100BASE-TX and 70 mA @ 3.3V for 10BASE-T.

**Note 6-2**  $T_A = 25^\circ\text{C}$ . Specification for packaged product only.

## 7.8 MDC/MDIO Timing

FIGURE 7-9: MDC/MDIO TIMING

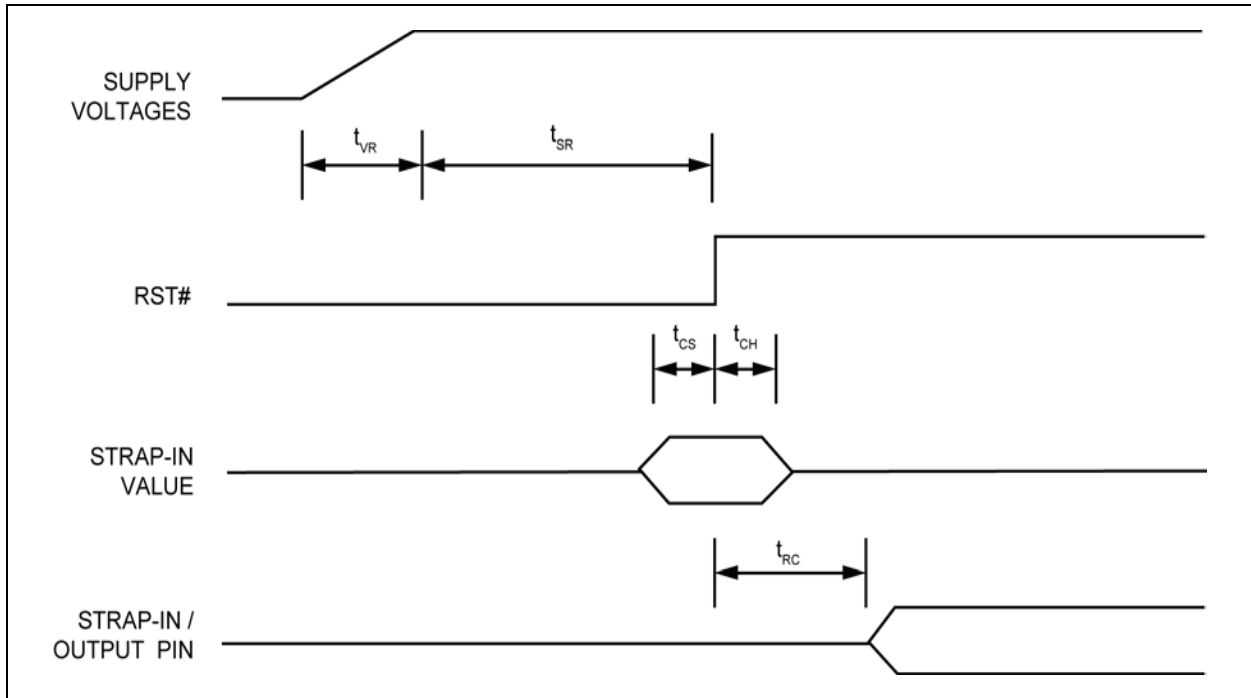

TABLE 7-9: MDC/MDIO TIMING PARAMETERS

Timing Parameter	Description	Min.	Typ.	Max.	Unit
$t_p$	MDC Period	—	400	—	ns
$t_{MD1}$	MDIO (PHY Input) Setup to Rising Edge of MDC	10	—	—	ns
$t_{MD2}$	MDIO (PHY Input) Hold from Rising Edge of MDC	4	—	—	ns
$t_{MD3}$	MDIO (PHY Output) Delay from Rising Edge of MDC	—	222	—	ns

## 7.9 Power-Up/Reset Timing

The KSZ8041NL/RNL reset timing requirement is summarized in Figure 7-10 and Figure 7-10.

**FIGURE 7-10: POWER-UP/RESET TIMING**

**TABLE 7-10: POWER-UP/RESET TIMING PARAMETERS**

Parameters	Description	Min	Max	Units
$t_{VR}$	Supply Voltage ( $V_{DDIO\_3.3}$ , $V_{DDA\_3.3}$ ) Rise Time	250	—	$\mu$ s
$t_{SR}$	Stable Supply Voltage to Reset High	10	—	ms
$t_{CS}$	Configuration Setup Time	5	—	ns
$t_{CH}$	Configuration Hold Time	5	—	ns
$t_{RC}$	Reset to Strap-In Pin Output	6	—	ns

The supply voltage ( $V_{DDIO\_3.3}$  and  $V_{DDA\_3.3}$ ) power-up waveform should be monotonic. The 250  $\mu$ s minimum rise time is from 10% to 90%.

After the deassertion of reset, it is recommended to wait a minimum of 100  $\mu$ s before starting programming on the MIIM (MDC/MDIO) Interface.

# KSZ8041NL/RNL

## 7.10 Reset Circuit

The reset circuit in [Figure 7-11](#) is recommended for powering up the KSZ8041NL/RNL if reset is triggered by the power supply.

**FIGURE 7-11: RECOMMENDED RESET CIRCUIT**

[Figure 7-12](#) shows a reset circuit recommended for applications where reset is driven by another device (for example, the CPU or an FPGA). The reset out RST\_OUT\_n from CPU/FPGA provides the warm reset after power up reset. D2 is required if using different V<sub>DDIO</sub> voltage between the switch and CPU/FPGA. Diode D2 should be selected to provide maximum 0.3V V<sub>F</sub> (Forward Voltage), for example, VISHAY BAT54, MSS1P2L. Alternatively, a level shifter device can also be used. D2 is not required if PHY and CPU/FPGA use same V<sub>DDIO</sub> voltage.

**FIGURE 7-12: RECOMMENDED RESET CIRCUIT FOR INTERFACING WITH CPU/FPGA RESET OUTPUT**

## 7.11 Reference Circuits for LED Strapping Pins

The [Figure 7-13](#) shows the reference circuits for pull-up, float, and pull-down on the LED1 and LED0 strapping pins.

**FIGURE 7-13: REFERENCE CIRCUITS FOR LED STRAPPING PINS**

# KSZ8041NL/RNL

## 8.0 SELECTION OF ISOLATION TRANSFORMER

A 1:1 isolation transformer is required at the line interface. An isolation transformer with integrated common-mode chokes is recommended for exceeding FCC requirements.

Table 8-1 gives the recommended transformer characteristics.

**TABLE 8-1: TRANSFORMER SELECTION CRITERIA**

Parameter	Value	Test Condition
Turns Ratio	1 CT : 1 CT	—
Open-Circuit Inductance (minimum)	350 $\mu$ H	100 mV, 100 kHz, 8 mA
Leakage Inductance (maximum)	0.4 $\mu$ H	1 MHz (minimum)
Inter-Winding Capacitance (typical)	12 pF	—
DC Resistance (typical)	0.9 $\Omega$	—
Insertion Loss (maximum)	-1.0 dB	0 MHz – 65 MHz
HIPOT (minimum)	1500 V <sub>RMS</sub>	—

**TABLE 8-2: QUALIFIED SINGLE PORT MAGNETICS**

Magnetic Manufacturer	Part Number	Auto MDI-X	Number of Ports
Bel Fuse	S558-5999-U7	Yes	1
Bel Fuse (Mag Jack)	SI-46001	Yes	1
Bel Fuse (Mag Jack)	SI-50170	Yes	1
Delta	LF8505	Yes	1
LanKom	LF-H41S	Yes	1
Pulse	H1102	Yes	1
Pulse (low cost)	H1260	Yes	1
Transpower	HB726	Yes	1
TDK (Mag Jack)	TLA-6T718	Yes	1

## 9.0 SELECTION OF REFERENCE CRYSTAL

TABLE 9-1: TYPICAL REFERENCE CRYSTAL CHARACTERISTICS

Characteristics	Value	Units
Frequency	25	MHz
Frequency Tolerance (maximum)	±50	ppm
Load Capacitance	20	pF
Series Resistance	40	Ω

## THE MICROCHIP WEB SITE

Microchip provides online support via our WWW site at [www.microchip.com](http://www.microchip.com). This web site is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the web site contains the following information:

- **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- **General Technical Support** – Frequently Asked Questions (FAQ), technical support requests, online discussion groups, Microchip consultant program member listing
- **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

## CUSTOMER CHANGE NOTIFICATION SERVICE

Microchip's customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip web site at [www.microchip.com](http://www.microchip.com). Under "Support", click on "Customer Change Notification" and follow the registration instructions.

## CUSTOMER SUPPORT

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- Local Sales Office
- Field Application Engineer (FAE)
- Technical Support

Customers should contact their distributor, representative or field application engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

**Technical support is available through the web site at: <http://microchip.com/support>**

## PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, for example, on pricing or delivery, refer to the factory or the listed sales office.

NOTES:

---

**Note the following details of the code protection feature on Microchip devices:**

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

**QUALITY MANAGEMENT SYSTEM**  
**CERTIFIED BY DNV**  
**== ISO/TS 16949 ==**

*Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.*
