

## 800 mA Fixed-Output CMOS LDO with Shutdown

### Features:

- Very Low Dropout Voltage
- 800 mA Output Current
- High Output Voltage Accuracy
- Standard or Custom Output Voltages
- Overcurrent and Overtemperature Protection

### Applications:

- Battery Operated Systems
- Portable Computers
- Medical Instruments
- Instrumentation
- Cellular/GSM/PHS Phones
- Linear Post-Regulators for SMPS
- Pagers

### Typical Application

### Description:

The TC1264 is a fixed-output, high-accuracy (typically  $\pm 0.5\%$ ) CMOS low dropout regulator. Designed specifically for battery-operated systems, the TC1264's CMOS construction eliminates wasted ground current, significantly extending battery life. Total supply current is typically  $80 \mu A$  at full load (20 to 60 times lower than in bipolar regulators).

TC1264 key features include ultra low noise operation, very low dropout voltage (typically 450 mV at full load), and fast response to step changes in load.

The TC1264 incorporates both over temperature and over current protection. The TC1264 is stable with an output capacitor of only  $1 \mu F$  and has a maximum output current of 800 mA. It is available in 3-pin SOT-223, 3-pin TO-220 and 3-pin DDPACK packages.

## 1.0 ELECTRICAL CHARACTERISTICS

### Absolute Maximum Ratings †

Input Voltage .....	6.5V
Output Voltage.....	(V <sub>SS</sub> – 0.3V) to (V <sub>IN</sub> + 0.3V)
Power Dissipation.....	Internally Limited ( <b>Note 8</b> )
Maximum Voltage on Any Pin .....	V <sub>IN</sub> +0.3V to -0.3V
Operating Temperature Range.....	-40°C < T <sub>J</sub> < 125°C
Storage Temperature.....	-65°C to +150°C

† **Notice:** Stresses above those listed under "Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operation listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

## 4.0 DETAILED DESCRIPTION

The TC1264 is a precision, fixed output LDO. Unlike bipolar regulators, the TC1264's supply current does not increase with load current. In addition,  $V_{OUT}$  remains stable and within regulation over the entire 0mA to  $I_{LOADMAX}$  load current range (an important consideration in RTC and CMOS RAM battery back-up applications).

Figure 4-1 shows a typical application circuit.

**FIGURE 4-1:** Typical Application Circuit.

## 4.1 Output Capacitor

A 1  $\mu$ F (min) capacitor from  $V_{OUT}$  to ground is required. The output capacitor should have an effective series resistance greater than 0.1 $\Omega$  and less than 5 $\Omega$ . A 1  $\mu$ F capacitor should be connected from  $V_{IN}$  to GND if there is more than 10 inches of wire between the regulator and the AC filter capacitor, or if a battery is used as the power source. Aluminum electrolytic or tantalum capacitor types can be used. (Since many aluminum electrolytic capacitors freeze at approximately -30°C, solid tantalums are recommended for applications operating below -25°C.) When operating from sources other than batteries, supply-noise rejection and transient response can be improved by increasing the value of the input and output capacitors and employing passive filtering techniques.

## 5.0 THERMAL CONSIDERATIONS

### 5.1 Thermal Shutdown

Integrated thermal protection circuitry shuts the regulator off when die temperature exceeds 160°C. The regulator remains off until the die temperature drops to approximately 150°C.

### 5.2 Power Dissipation

The amount of power the regulator dissipates is primarily a function of input and output voltage, and output current. The following equation is used to calculate worst-case actual power dissipation:

#### EQUATION 5-1:

$$P_D = (V_{INMAX} - V_{OUTMIN})I_{LOADMAX}$$

Where:

$P_D$  = Worst-case actual power dissipation  
 $V_{INMAX}$  = Maximum voltage on  $V_{IN}$   
 $V_{OUTMIN}$  = Minimum regulator output voltage  
 $I_{LOADMAX}$  = Maximum output (load) current

The maximum allowable power dissipation (Equation 5-2) is a function of the maximum ambient temperature ( $T_{AMAX}$ ), the maximum allowable die temperature ( $T_{JMAX}$ ) and the thermal resistance from junction-to-air ( $\theta_{JA}$ ).

#### EQUATION 5-2:

$$P_{DMAX} = \frac{(T_{JMAX} - T_{AMAX})}{\theta_{JA}}$$

Where all terms are previously defined.

Table 5-1 and Table 5-2 show various values of  $\theta_{JA}$  for the TC1264 packages.

**TABLE 5-1: THERMAL RESISTANCE GUIDELINES FOR TC1264 IN SOT-223 PACKAGE**

Copper Area (Topside)*	Copper Area (Backside)	Board Area	Thermal Resistance ( $\theta_{JA}$ )
2500 sq mm	2500 sq mm	2500 sq mm	45°C/W
1000 sq mm	2500 sq mm	2500 sq mm	45°C/W
225 sq mm	2500 sq mm	2500 sq mm	53°C/W
100 sq mm	2500 sq mm	2500 sq mm	59°C/W
1000 sq mm	1000 sq mm	1000 sq mm	52°C/W
1000 sq mm	0 sq mm	1000 sq mm	55°C/W

\* Tab of device attached to topside copper

**TABLE 5-2: THERMAL RESISTANCE GUIDELINES FOR TC1264 IN 3-PIN DDPK/TO-220 PACKAGE**

Copper Area (Topside)*	Copper Area (Backside)	Board Area	Thermal Resistance ( $\theta_{JA}$ )
2500 sq mm	2500 sq mm	2500 sq mm	25°C/W
1000 sq mm	2500 sq mm	2500 sq mm	27°C/W
125 sq mm	2500 sq mm	2500 sq mm	35°C/W

\* Tab of device attached to topside copper

Equation 5-1 can be used in conjunction with Equation 5-2 to ensure regulator thermal operation is within limits. For example:

Given:

$$\begin{aligned} V_{INMAX} &= 3.3V \pm 10\% \\ V_{OUTMIN} &= 2.7V \pm 0.5\% \\ I_{LOADMAX} &= 275 \text{ mA} \\ T_{JMAX} &= 125^\circ\text{C} \\ T_{AMAX} &= 95^\circ\text{C} \\ \theta_{JA} &= 59^\circ\text{C/W (SOT-223)} \end{aligned}$$

Find:

- Actual power dissipation.
- Maximum allowable dissipation.

Actual power dissipation:

$$\begin{aligned} P_D &\approx (V_{INMAX} - V_{OUTMIN})I_{LOADMAX} \\ P_D &= (3.3 \times 1.1) - (2.7 \times .995)275 \times 10^{-3} \\ P_D &= 260 \text{ mW} \end{aligned}$$

Maximum allowable power dissipation:

$$\begin{aligned} P_{DMAX} &= \frac{T_{JMAX} - T_{AMAX}}{\theta_{JA}} \\ P_{DMAX} &= \frac{(125 - 95)}{59} \\ P_{DMAX} &= 508 \text{ mW} \end{aligned}$$

In this example, the TC1264 dissipates a maximum of 260 mW, which is below the allowable limit of 508 mW. In a similar manner, Equation 5-1 and Equation 5-2 can be used to calculate maximum current and/or input voltage limits. For example, the maximum allowable  $V_{IN}$ , is found by substituting the maximum allowable power dissipation of 508 mW into Equation 5-1, from which  $V_{INMAX} = 4.6V$ .

## APPENDIX A: REVISION HISTORY

### Revision D (September 2010)

The following is the list of modifications:

1. Updated [Figure 2-4](#).
2. Updated package drawings (C04-011B, C04-2011A, C04-032B, C04-2032A, C04-034B).

### Revision C (October 2006)

The following is the list of modifications:

1. **Section 1.0 “Electrical Characteristics”:** Changed dropout voltage typical value for  $I_L = 500$  mA from 700 to 1000 and maximum value from 1000 to 1200 for. Changed typical value for  $I_L = 800$  mA from 890 to 1200.
2. **Section 6.0 “PackAging Information”:** Added package marking information and package outline drawings.
3. Added disclaimer to package outline drawings.

### Revision B (May 2002)

- Undocumented Changes.

### Revision A (March 2002)

- Original Release of this Document.

**Note the following details of the code protection feature on Microchip devices:**

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.
