MCP14A0901/2

9.0A MOSFET Driver with Low Threshold Input and Enable

Features

- High Peak Output Current: 9.0A (typical)
- Wide Input Supply Voltage Operating Range:
  - 4.5V to 18V
- Low Shoot-Through/Cross-Conduction Current in Output Stage
- High Capacitive Load Drive Capability:
  - 10,000 pF in 24 ns (typical)
- Short Delay Times: 27 ns (t_{D1}), 27 ns (t_{D2}) (typical)
- Low Supply Current: 360 µA (typical)
- Low-Voltage Threshold Input and Enable with Hysteresis
- Latch-Up Protected: Withstands 500 mA Reverse Current
- Space-Saving Packages:
  - 8-Lead MSOP
  - 8-Lead SOIC
  - 8-Lead 2 x 3 TDFN

Applications

- Switch Mode Power Supplies
- Pulse Transformer Drive
- Line Drivers
- Level Translator
- Motor and Solenoid Drive

General Description

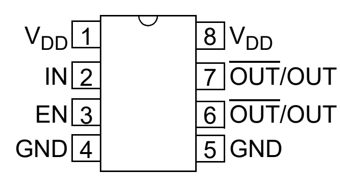
The MCP14A0901/2 devices are high-speed MOSFET drivers that are capable of providing up to 9.0A of peak current while operating from a single 4.5V to 18V supply. There are two output configurations available; inverting (MCP14A0901) and noninverting (MCP14A0902). These devices feature low shoot-through current, fast rise and fall times, and matched propagation delays which make them ideal for high switching frequency applications.

The MCP14A0901/2 family of devices offers enhanced control with Enable functionality. The active-high Enable pin can be driven low to drive the output of the MCP14A0901/2 low, regardless of the status of the Input pin. An integrated pull-up resistor allows the user to leave the Enable pin floating for standard operation.

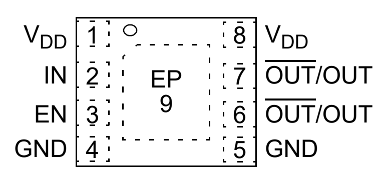
These devices are highly latch-up resistant under any condition within their power and voltage ratings. They can accept up to 500 mA of reverse current being forced back into their outputs without damage or logic upset. All terminals are fully protected against electrostatic discharge (ESD) up to 2 kV (HBM) and 200V (MM).

Package Types

MCP14A0901/MCP14A0902
MSOP/SOIC

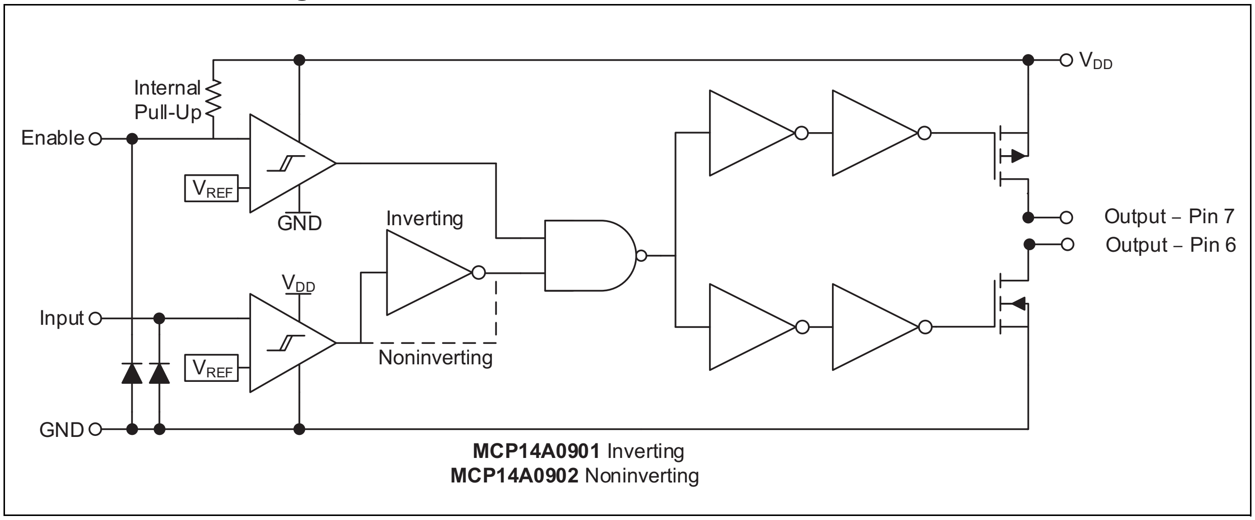


MCP14A0901/MCP14A0902
2 x 3 TDFN*



* Includes Exposed Thermal Pad (EP); see Table 3-1.

Functional Block Diagram



1.0 ELECTRICAL CHARACTERISTICS

Absolute Maximum Ratings †

V_{DD}, Supply Voltage ....+20V
V_{IN}, Input Voltage .... (V_{DD} + 0.3V) to (GND - 0.3V)
V_{EN}, Enable Voltage....... (V_{DD} + 0.3V) to (GND - 0.3V)
Package Power Dissipation (T_A = +50°C)
  8L MSOP ....0.63 W
  8L SOIC ....1.00 W
  8L 2 x 3 TDFN..1.86 W
ESD Protection on all pins ....2 kV (HBM)
....200V (MM)

† Notice: Stresses above those listed under "Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational sections of this specification is not intended. Exposure to maximum rating conditions for extended periods may affect device reliability.

DC CHARACTERISTICS

Electrical Specifications: Unless otherwise noted, T_A = +25°C, with 4.5V ≤ V_{DD} ≤ 18V.						
Parameters	**Sym.**	**Min.**	**Typ.**	**Max.**	**Units**	**Conditions**
Input

3.0 PIN DESCRIPTIONS

The descriptions of the pins are listed in Table 3-1.

TABLE 3-1: PIN FUNCTION TABLE

MCP14A0901/2		Symbol	Description
8L MSOP/SOIC	8L 2 x 3 TDFN		
1	1	V_{DD}	Supply Input
2	2	IN	Control Input
3	3	EN	Device Enable
4	4	GND	Power Ground
5	5	GND	Power Ground
6	6	$\overline{OUT}$/OUT	Push-Pull Output
7	7	$\overline{OUT}$/OUT	Push-Pull Output
8	8	V_{DD}	Supply Input
—	EP	EP	Exposed Thermal Pad (GND)

3.1 Supply Input Pin (V_{DD})

V_{DD} is the bias supply input for the MOSFET driver and has a voltage range of 4.5V to 18V. This input must be decoupled to ground with a local capacitor. This bypass capacitor provides a localized low-impedance path for the peak currents that are provided to the load.

3.2 Control Input Pin (IN)

The MOSFET driver Control Input is a high-impedance input featuring low threshold levels. The Input also has hysteresis between the high and low input levels, allowing them to be driven from slow rising and falling signals and to provide noise immunity.

3.3 Device Enable Pin (EN)

The MOSFET driver Device Enable is a high-impedance input featuring low threshold levels. The Enable input also has hysteresis between the high and low input levels, allowing them to be driven from slow rising and falling signals and to provide noise immunity. Driving the Enable pin below the threshold will disable the output of the device, pulling $\overline{OUT}$/OUT low, regardless of the status of the Input pin. Driving the Enable pin above the threshold allows normal operation of the $\overline{OUT}$/OUT pin based on the status of the Input pin. The Enable pin utilizes an internal pull up resistor, allowing the pin to be left floating for standard driver operation.

3.4 Power Ground Pin (GND)

GND is the device return pin for the input and output stages. The GND pin should have a low-impedance connection to the bias supply source return. When the capacitive load is being discharged, high peak currents will flow through the ground pin.

3.5 Output Pin ($\overline{OUT}$, OUT)

The Output is a CMOS push-pull output that is capable of sourcing and sinking 9.0A of peak current (V_{DD} = 18V). The low output impedance ensures the gate of the external MOSFET stays in the intended state even during large transients. This output also has a reverse current latch-up rating of 500 mA.

3.6 Exposed Metal Pad Pin (EP)

The exposed metal pad of the DFN package is internally connected to GND. Therefore, this pad should be connected to a Ground plane to aid in heat removal from the package.

4.0 APPLICATION INFORMATION

4.1 General Information

MOSFET drivers are high-speed, high-current devices which are intended to source/sink high-peak currents to charge/discharge the gate capacitance of external MOSFETs or Insulated-Gate Bipolar Transistors (IGBTs). In high-frequency switching power supplies, the Pulse-Width Modulation (PWM) controller may not have the drive capability to directly drive the power MOSFET. A MOSFET driver such as the MCP14A0901/2 family can be used to provide additional source/sink current capability.

4.2 MOSFET Driver Timing

The ability of a MOSFET driver to transition from a fully-off state to a fully-on state is characterized by the driver's rise time (t_R), fall time (t_F) and propagation delays (t_{D1} and t_{D2}). Figure 4-1 and Figure 4-2 show the test circuit and timing waveform used to verify the MCP14A0901/2 timing.

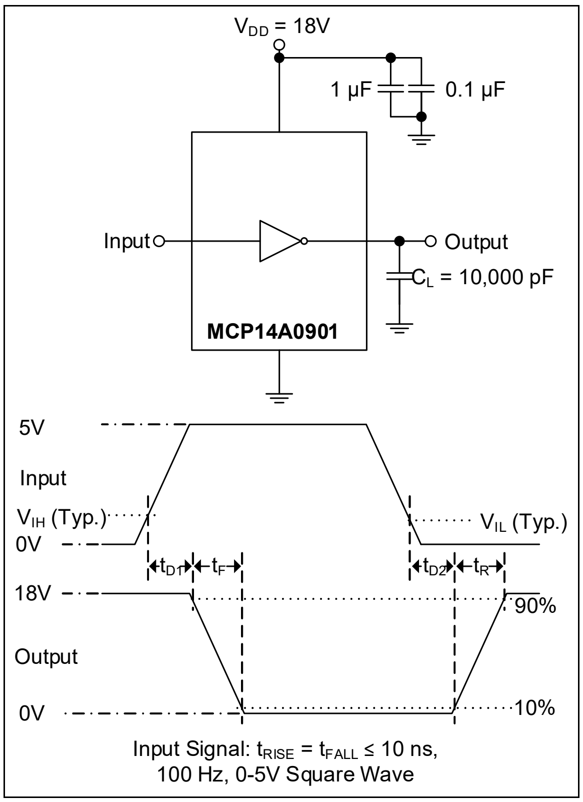

FIGURE 4-1: Inverting Driver Timing Waveform.

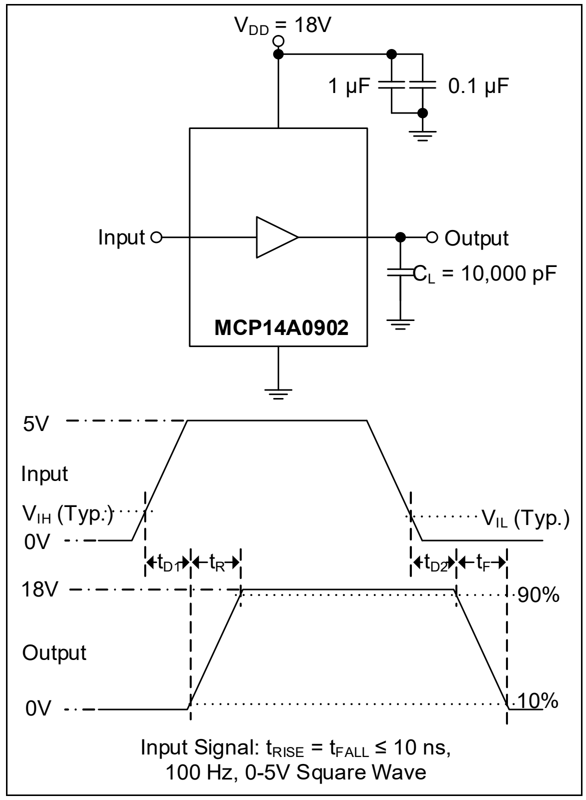

FIGURE 4-2: Noninverting Driver Timing Waveform.

4.3 Enable Function

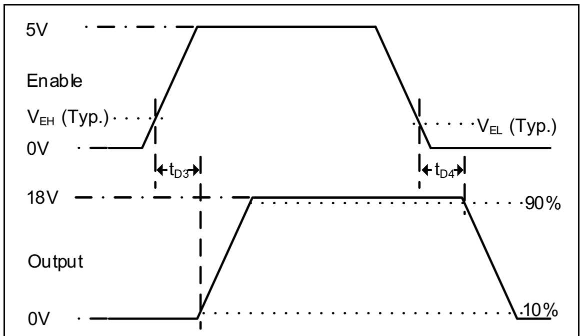
The enable pin (EN) provides additional control of the output pin (OUT). This pin is active high and is internally pulled up to V_{DD} so that the pin can be left floating to provide standard MOSFET driver operation.

When the enable pin's input voltage is above the enable pin high voltage threshold, (V_{EN_H}), the output is enabled and allowed to react to the status of the Input pin. However, when the voltage applied to the Enable pin falls below the low threshold voltage (V_{EN_L}), the driver's output is disabled and does not respond to changes in the status of the Input pin. When the driver is disabled, the output is pulled down to a low state. Refer to Table 4-1 for enable pin logic. The threshold voltage levels for the Enable pin are similar to the threshold voltage levels of the Input pin. Hysteresis is provided to help increase the noise immunity of the enable function, avoiding false triggers of the enable signal during driver switching.

There are propagation delays associated with the driver receiving an enable signal and the output reacting. These propagation delays, t_{D3} and t_{D4}, are graphically represented in Figure 4-3.

TABLE 4-1: ENABLE PIN LOGIC

ENB	IN	MCP14A0901 $\overline{\text{OUT}}$	MCP14A0902 OUT
H	H	L	H
H	L	H	L
L	X	L	L



Enable Signal: $t_{RISE} = t_{FALL} \leq 10$ ns, 100 Hz, 0-5V Square Wave

FIGURE 4-3: *Enable Timing Waveform.*

4.4 Decoupling Capacitors

Careful PCB layout and decoupling capacitors are required when using power MOSFET drivers. Large currents are required to charge and discharge capacitive loads quickly. For example, approximately 720 mA are needed to charge a 1000 pF load with 18V in 25 ns.

To operate the MOSFET driver over a wide frequency range with low supply impedance, it is recommended to place 1.0 µF and 0.1 µF low ESR ceramic capacitors in parallel between the driver V_{DD} and GND. These capacitors should be placed close to the driver to minimize circuit board parasitics and provide a local source for the required current.

4.5 PCB Layout Considerations

Proper Printed Circuit Board (PCB) layout is important in high-current, fast-switching circuits to provide proper device operation and robustness of design. Improper component placement may cause errant switching, excessive voltage ringing or circuit latch-up. The PCB trace loop length and inductance should be minimized by the use of ground planes or traces under the MOSFET gate drive signal. Separate analog and power grounds and local driver decoupling should also be used.

Placing a ground plane beneath the MCP14A0901/2 devices will help as a radiated noise shield, as well as providing some heat sinking for power dissipated within the device.

4.6 Power Dissipation

The total internal power dissipation in a MOSFET driver is the summation of three separate power dissipation elements, as shown in Equation 4-1.

EQUATION 4-1:

$$P_T = P_L + P_Q + P_{CC}$$

Where:

P_T	=	Total power dissipation
P_L	=	Load power dissipation
P_Q	=	Quiescent power dissipation
P_{CC}	=	Operating power dissipation

4.6.1 CAPACITIVE LOAD DISSIPATION

The power dissipation caused by a capacitive load is a direct function of the frequency, total capacitive load and supply voltage. The power lost in the MOSFET driver for a complete charging and discharging cycle of a MOSFET is shown in Equation 4-2.

EQUATION 4-2:

$$P_L = f \times C_T \times V_{DD}^2$$

Where:

f	=	Switching frequency
C_T	=	Total load capacitance
V_{DD}	=	MOSFET driver supply voltage

4.6.2 QUIESCENT POWER DISSIPATION

The power dissipation associated with the quiescent current draw depends on the state of the Input and Enable pins. See **Section 1.0 "Electrical Characteristics"** for typical quiescent current draw values in different operating states. The quiescent power dissipation is shown in Equation 4-3.

EQUATION 4-3:

$$P_Q = (I_{QH} \times D + I_{QL} \times (1 - D)) \times V_{DD}$$

Where:

I_{QH}	=	Quiescent current in the High state
D	=	Duty cycle
I_{QL}	=	Quiescent current in the Low state
V_{DD}	=	MOSFET driver supply voltage

4.6.3 OPERATING POWER DISSIPATION

The operating power dissipation occurs each time the MOSFET driver output transitions because, for a very short period of time, both MOSFETs in the output stage are on simultaneously. This cross-conduction current leads to a power dissipation described in Equation 4-4.

EQUATION 4-4:

$$P_{CC} = V_{DD} \times I_{CO}$$

Where:

I_{CO}	=	Crossover current
V_{DD}	=	MOSFET driver supply voltage

8-Lead Plastic Small Outline (SN) - Narrow, 3.90 mm (.150 In.) Body [SOIC]

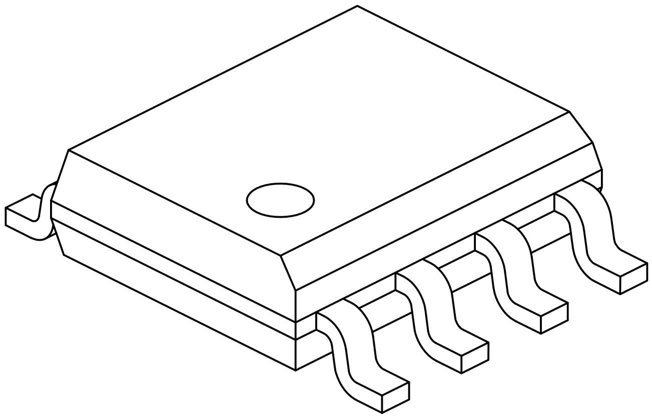
Note: For the most current package drawings, please see the Microchip Packaging Specification located at http://www.microchip.com/packaging



Units		MILLIMETERS		
Dimension Limits		MIN	NOM	MAX
Number of Pins	N		8	
Pitch	e		1.27 BSC	
Overall Height	A	-	-	1.75
Molded Package Thickness	A2	1.25	-	-
Standoff §	A1	0.10	-	0.25
Overall Width	E		6.00 BSC	
Molded Package Width	E1		3.90 BSC	
Overall Length	D		4.90 BSC	
Chamfer (Optional)	h	0.25	-	0.50
Foot Length	L	0.40	-	1.27
Footprint	L1		1.04 REF	
Foot Angle	φ	0°	-	8°
Lead Thickness	c	0.17	-	0.25
Lead Width	b	0.31	-	0.51
Mold Draft Angle Top	α	5°	-	15°
Mold Draft Angle Bottom	β	5°	-	15°

Notes:

1. Pin 1 visual index feature may vary, but must be located within the hatched area.
2. § Significant Characteristic
3. Dimensions D and E1 do not include mold flash or protrusions. Mold flash or protrusions shall not exceed 0.15mm per side.
4. Dimensioning and tolerancing per ASME Y14.5M
   BSC: Basic Dimension. Theoretically exact value shown without tolerances.
   REF: Reference Dimension, usually without tolerance, for information purposes only.
5. Datums A & B to be determined at Datum H.

RECOMMENDED LAND PATTERN

Units		MILLIMETERS		
Dimension Limits		MIN	NOM	MAX
Contact Pitch	E		0.50 BSC	
Optional Center Pad Width	X2			1.60
Optional Center Pad Length	Y2			1.50
Contact Pad Spacing	C		2.90	
Contact Pad Width (X8)	X1			0.25
Contact Pad Length (X8)	Y1			0.85
Thermal Via Diameter	V		0.30	
Thermal Via Pitch	EV		1.00	

Notes:

1. Dimensioning and tolerancing per ASME Y14.5M
   BSC: Basic Dimension. Theoretically exact value shown without tolerances.
2. For best soldering results, thermal vias, if used, should be filled or tented to avoid solder loss during reflow process

Microchip Technology Drawing No. C04-129-MNY Rev. B

APPENDIX A: REVISION HISTORY

Revision A (March 2019)

- Original release of this document.

NOTES:

PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

PART NO.	[X][(1)]	–X	/XX
Device	Tape and Reel	Temperature Range	Package

Device:

MCP14A0901:	High-Speed MOSFET Driver
MCP14A0902:	High-Speed MOSFET Driver
MCP14A0901T:	High-Speed MOSFET Driver (Tape and Reel)
MCP14A0902T:	High-Speed MOSFET Driver (Tape and Reel)

Temperature Range: E = -40°C to +125°C (Extended)

Package:

MS	= 8-Lead Plastic Micro Small Outline Package (MSOP)
SN	= 8-Lead Plastic Small Outline - Narrow, 3.90 mm Body (SOIC)
MNY	= 8-Lead Plastic Dual Flat, No Lead Package - 2 x 3 x 0.75 mm Body (TDFN)
Y*	= Nickel palladium gold manufacturing designator. Only available on the SC70 and TDFN packages.

Examples:

a) MCP14A0901T-E/MS: Tape and Reel, Extended temperature, 8LD MSOP package

b) MCP14A0901-E/MS: Extended temperature, 8LD MSOP package

c) MCP14A0902T-E/SN: Tape and Reel, Extended temperature, 8LD SOIC package

d) MCP14A0902-E/SN: Extended temperature, 8LD SOIC package

e) MCP14A0902T-E/MNY: Tape and Reel, Extended temperature, 8LD TDFN package

Note 1: Tape and Reel identifier only appears in the catalog part number description. This identifier is used for ordering purposes and is not printed on the device package. Check with your Microchip Sales Office for package availability with the Tape and Reel option.

NOTES:

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.

Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
