# High Voltage, Low Noise, Inductorless EL Lamp Driver 

## Features

- No external components required when using an external EL clock frequency
- EL frequency can be set by an external resistor
- Low Noise
- DC to AC converter
- Drives up to 5.3 nF (approx. 1.5in² lamp) load
- Output voltage regulation
- Enable function
- EL Lamp dimming

## Applications

- Cellular phone keypad
- Watches
- Small handheld wireless devices
- MP3 Players

## General Description

The Supertex HV852 is a high voltage, low noise, inductorless EL (electroluminescent) lamp driver. It is designed to drive EL lamps of up to $1.5 \mathrm{in}^{2}$, with capacitive values up to 5.3 nF over an input voltage range of 2.4 to 5.0 V . The HV852 converts a low voltage DC input to a high voltage AC output across an EL lamp. It uses a charge pump scheme to boost the input voltage eliminating the need for an external inductor, diode, and high voltage capacitor commonly found in conventional topologies.

The charge pump circuit discharges its energy into an EL lamp through a high voltage H -bridge. Once the voltage reaches its regulated limit, it is turned off to conserve power. The EL lamp is then discharged to ground and the H -bridge changes state to allow the charge pump to charge the EL lamp in the opposite direction.

## Typical Application Circuit

EL Lamp frequency set by $\mathrm{R}_{\mathrm{EL}}$

## Ordering Information

| Device | Package Options |  |
| :---: | :---: | :---: |

## Absolute Maximum Ratings

| Parameter | Value |
| :--- | ---: |
| $\mathrm{V}_{\mathrm{DD}}$, supply voltage | -0.5 V to 6.5 V |
| Operating temperature | $-25^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ |
| Storage temperature | $-65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$ |
| Power dissipation: 8-Lead MSOP | 300 mW |
| Power dissipation: 10-Lead DFN | 1.6 W |

Absolute Maximum Ratings are those values beyond which damage to the device may occur. Functional operation under these conditions is not implied. Continuous operation of the device at the absolute rating level may affect device reliability. All voltages are referenced to device ground.

## Pin Configurations

Note:
Pads are at the bottom of the package. Center heat slug is at ground potential.

## Product Marking

Package may or may not include the following marks: Si or 54
10-Lead DFN (K7)

EL Lamp Dimming Using PWM
EL lamp dimming can be achieved by applying a PWM signal to the ENABLE pin. EL Lamp brightness is proportional to the PWM signal duty cycle. This is done by pulse skipping the output pulses. The PWM frequency should be kept below the EL frequency but above 50 Hz to avoid flickering.

## Pin Description

| Name | 8-Lead <br> MSOP | 10-Lead <br> DFN | Description |
| :---: | :---: | :---: | :--- |
| VDD | 1 | 1,5 | Input supply voltage pin. |
| REL | 2 | 2 | An external resistor to VDD will set the EL lamp frequency. The EL frequency is inversely <br> proportional to the $R_{\text {EL }}$ resistor value. A $1.5 \mathrm{M} \Omega$ resistor would provide a nominal lamp <br> frequency of 250 Hz . <br> When using an external clock to set the EL lamp frequency, the REL pin should be <br> connected to ground. |
| EN | 3 | 3 | Enable input pin. Logic high will turn the device on. An external R-C circuit can be added <br> for a delayed turn off. |
| CLKIN | 4 | 4 | Logic input pin. An external logic clock applied to this pin can be used to set the EL lamp <br> frequency (see Figure 3). The EL lamp frequency is the external clock frequency divided <br> by 128. This is useful for applications requiring the EL lamp to be synchronized to a <br> system clock. Connect to ground when not in use. |
| CLKEN | 5 | 6 | Logic input pin. Logic high will cause the EL lamp frequency to be set by the CLKIN <br> input. Logic low will cause the EL lamp frequency to be set by the external $R_{E L}$ resistor. |
| GND | 6 | 7,8 | IC ground pin. <br> VB7 <br> 9 |
| VA | 8 | 10 | EL lamp driver output pin. The EL lamp is connected across VA and VB terminals. |
